Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
§250.198(h)(63)	(63) API Standard 53, Blowout Prevention Equipment and Systems for Drilling Wells, Fourth Edition, November,2012, incorporated by reference at §§ 250.730m 250.735, 250.737 and 240.739.	In order to remain current with the standards developed and adopted by industry, industry recommends that the regulations incorporate API Standard 53 4^{th} Edition with its Addendum 1, issued in July 2016. Industry is finalizing the 5th edition of API 53, once it is published, consideration for incorporation by reference should be taken to ensure the U.S. OCS is operating to the latest API standard for well control systems and is consistent with the remainder of operations around the world.	Revise 250.198(h)(63) to read: API Standard 53, Blowout Prevention Equipment and Systems for Drilling Wells, Fourth Edition, November,2012, with Addendum 1, July 2016, incorporated by reference at §§ 250.730m 250.735, 250.737 and 240.739.
§250.198(h)(78)	(78) API Standard 65—Part 2, Isolating Potential Flow Zones During Well Construction; Second Edition, December 2010; incorporated by reference at §§ 250.415(f) and 250.420(a)(6);	Industry supports the proposed change which will clarify that the centralization requirements will be governed by API Standard 65-2, reducing the	None. The proposed change is supported.

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		possibility of inconsistent application across BSEE.	
§250.198 (h)(94)	(94) API Recommended Practice 17H, Remotely Operated Tool and Interfaces on Subsea Production Systems, Second Edition, June 2013, Errata January 2014, incorporated by reference at § 250.734(a)(4);	Industry supports the incorporation by reference of the updated edition of this standard for the reasons given in the preamble of the proposed rule.	None. The proposed change is supported.
§250.413(g)	(g) A single plot containing curves for estimated pore pressures, formation fracture gradients, proposed drilling fluid weights (surface and downhole), planned safe drilling margin, and casing setting depths in true vertical measurements;	In accordance with long standing practices between BSEE and Industry, Industry has reviewed and concurs with providing additional details as requested by BSEE. This continues to follow industry practice of providing additional data at the request of BSEE.	None. The proposed change is supported.
§250.414(c)	(c) Planned safe drilling margin that is between the estimated pore pressure and the lesser of estimated fracture gradients or casing shoe pressure integrity test and that is based on a risk assessment consistent with expected well conditions and operations. (1) Your safe drilling margin must also include use of equivalent downhole mud weight that is: (i) greater than the estimated pore pressure, and	The 0.5 ppg value is arbitrary and does not ensure safety. Maintaining the equivalent downhole mud weight above pore pressure manages the potential for influx while managing equivalent circulating	(c) Your Conceptual Deepwater Operations Plan or APD must include a planned safe drilling margin that is between the estimated pore pressure and the lesser of estimated fracture gradients or casing shoe pressure integrity test

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
	(ii) except as provided in paragraph (c) (2) of this section, a minimum of 0.5 pound per gallon below the lower of the casing shoe pressure integrity test or the lowest estimated fracture gradient. (2) In lieu of meeting the criteria in paragraph (c)(1)(ii) of this section, you may use an equivalent downhole mud weight as specified in your APD, provided that you submit adequate documentation (such as risk modeling data, off-set well data, analog data, seismic data) to justify the alternative equivalent downhole mud weight. (3) When determining the pore pressure and lowest estimated fracture gradient for a specific interval, you must consider related off-set and analogous well behavior observations, if available.	density below fracture gradient (or casing shoe pressure integrity test) manages lost circulation. The regulation should focus on establishing downhole mud weight within this operational window. Further, retaining the arbitrary 0.5 ppg margin hinders promotion of enhanced technology related to drilling fluids and engineering in well design. By prohibiting this evolution, the regulation could preclude future wells from being drilled safer. The implementation of these technologies will be necessary to enable development of future offshore resources. Industry would like to propose an engineered, performance-based approach standard and suggest replacing current	and based on a risk assessment consistent with expected well conditions and operations. (1) Your safe drilling margin must provide for: (i) equivalent downhole mud weight that is greater than the estimated pore pressure, and (ii) equivalent circulating density, supported with hydraulic modeling or other documentation (such as risk modeling data, related analog well data, seismic data), that is actively managed below the lower of the casing shoe pressure integrity test or the lowest estimated fracture gradient.

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		text to the rule with recommended industry text. In the view of industry, the proposed text was developed to address the concerns and issues that BSEE raised within the preamble text. It is believed that the comments in this letter demonstrate the improved safety and clarity, to industry and the regulator, due to this proposed change. In an effort to build confidence for field development, industry proposes that BSEE apply this proposed text and include CDWOP and APD into the text, in an effort to provide opportunity for early alignment with BSEE for major capital investments going forward. Industry believes that the proposed text changes	

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		supports current practices and District Manager approval requirement is retained for all cases.	
§250.420(a)(6)	(6) Provide adequate centralization consistent with the guidelines of API Standard 65 –Part 2 (as incorporated by reference in § 250.198); and	Industry supports the proposed change which will clarify that the centralization requirements will be governed by API Standard 65-2, reducing the possibility of inconsistent application across BSEE.	None. The proposed change is supported.

	cement returns to mudline or expected height, cement channeling, or failure of equipment), Then you must: (1) Locate the top of cement by: (i) Running a temperature survey; (ii) Running a cement evaluation log; (iii) Using tracers in the cement and logging them prior to drill out; or (iv) Using a combination of these techniques. (2) Determine if your cement job is inadequate. If your cement job is determined to be inadequate, refer to paragraph (d) of this section. (3) If your cement job is determined to be adequate, report the results to the District Manager in your submitted WAR.	helpful. The concern is around the requirement to log prior to drill out. Some operators are creating extensive shoe tracks to avoid wet shoes and requiring logging be complete prior to drill out might create some inefficiencies that do not change the risk profile. Tracers are meant to be used when the losses are more likely, and TOC should be able to be found through the BHA.	indication of inadequate cement job (such as unplanned lost returns, no cement returns to mudline or expected height, cement channeling, or failure of equipment), Then you must: (1) Locate the top of cement by: (i) Running a temperature survey; (ii) Running a cement evaluation log; (iii) Using tracers in the cement ~~and logging them prior to drill out~~; or (iv) Using a combination of these techniques. (2) Determine if your cement job is inadequate. If your cement job is determined to be inadequate, refer to paragraph (d) of this section. (3) If your cement job is determined to be adequate, report the results to the District Manager in your submitted WAR.

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
§250.428(d)	Comply with § 250.428(c)(1) and take remedial actions. The District Manager must review and approve all remedial actions either through a previously approved contingency plan within the permit or remedial actions included in a revised permit before you may take them, unless immediate actions must be taken to ensure the safety of the crew or to prevent a well-control event. If you complete any immediate action to ensure the safety of the crew or to prevent a well-control event, submit a description of the action to the District Manager when that action is complete. Any changes to the well program, that are not included in the approved permit, will require submittal of a certification by a professional engineer (PE) certifying that they have reviewed and approved the proposed changes. You must also meet any other requirements of the District Manager for remedial actions.	Industry agrees with the proposed changes. In part D, changes will allow for preapproval of contingency plans such as liner top squeezes, shoe squeezes, etc. in addition to the normal method of approval via RPD. This should help minimize rigging having idle time associated with RPD process.	Recommend adding "if necessary" in §250.428(d). I.e.: Comply with §250.428(c)(1), and take remedial actions, if necessary. The District Manager must review and approve all remedial actions either through a previously approved contingency plan within the permit or remedial actions included in a revised permit before you may take them, unless immediate actions must be taken to ensure the safety of the crew or to prevent a well-control event. If you complete any immediate action to ensure the safety of the crew or to prevent a well-control event, submit a description of the action to the District Manager when that action is complete. Any changes to the well program, that are not included in the approved permit, will require submittal of a certification by a professional engineer (PE)

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
			certifying that they have reviewed and approved the proposed changes. You must also meet any other requirements of the District Manager for remedial actions.
§250.433(b)	(b) For floating drilling operations with a subsea BOP stack, you must actuate the diverter system within 7 days after the previous actuation. For subsequent testing, you may partially actuate the diverter element and a flow test is not required.	Industry agrees with the proposed change. This language reduces the possibility of damaging the diverter element during frequent total actuation and will improve safety.	None. The proposed change is supported.
§250.461(b)	(b) Survey requirements for directional well. You must conduct directional surveys on each directional well and digitally record the results. Surveys must give both inclination and azimuth at intervals not to exceed 500 feet during the normal course of drilling. Intervals during angle changing portions of the hole may not exceed 180 feet.	Industry agrees with the proposed change. This is a practical change that will improve efficiency without sacrificing accuracy as many rigs now have stands of drill pipe over150 feet.	None. The proposed change is supported.
§250.462	What are the source control, containment, and collocated equipment requirements?	The proposed changes to 30 CFR 250.462 clarify the source control equipment requirements based on the operator's Regional Containment Demonstration (RCD) or	None. The proposed change is supported.

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		Well Containment Plan (WCP). Similar to spill equipment (e.g. skimmers, sorbent boom, etc.), the majority of source control equipment has no other commercial purpose and is used solely for emergent containment operations, such as capping stacks, top hats and subsea dispersant wands. This unique containment equipment is maintained by HWCG or Marine Well Containment Company and readily available for inspection at any time and maintained and stored for immediate use if an event occurs. Other equipment listed for source control that has broad commercial purpose, such as Remotely Operated Vehicles and vessels are readily available and frequently inspected and maintained for safe and efficient normal operations.	

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		Proposed revisions to paragraph (e)(3) would clarify that subsea utility equipment utilized solely for containment operations must be available for inspection at all times. Paragraph (e)(4) would also be revised to clarify that it is applicable only to collocated equipment identified in the Regional Containment Demonstration (RCD) or Well Containment Plan and not all collocated equipment. The proposed revisions to both paragraphs (e)(3) and (e)(4) would help ensure that the applicable respective equipment is available for inspection. BSEE recognizes that some of the equipment used for containment is used for other types of operations on the OCS and would be available for inspection	

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		when in use during other well operations.	
§250.518(e)(1)	(1) All permanently installed packers and bridge plugs qualified as mechanical barriers must comply with ANSI/API Spec. 11D1 (as incorporated by reference in §250.198).	Industry agrees with the proposed change as it would minimize the number of alternate equipment requests submitted to BSEE.	None. The proposed change is supported.
§250.519	Once you install your wellhead, you must meet the casing pressure management requirements of API RP 90 (as incorporated by reference in § 250.198) and the requirements of §§ 250.519 through 250.531. If there is a conflict between API RP 90 and the casing pressure requirements of this subpart, you must follow the requirements of this subpart.	Industry agrees with the proposed administrative change to update incorrect citations.	None. The proposed change is supported.
§250.522	A newly completed or recompleted well often has thermal casing pressure during initial startup. Bleeding casing pressure during the startup process is considered a normal and necessary operation to manage thermal casing pressure; therefore, you do not need to evaluate these operations as a casing diagnostic test. After 30 days of continuous production, the initial production startup operation is complete, and you must perform casing diagnostic testing as required in §§ 250.521 and 250.523.	Industry agrees with the proposed administrative change to update incorrect citations.	None. The proposed change is supported.
§250.525(d)	(d) Any well that has sustained casing pressure (SCP) and is bled down to prevent it from exceeding its MAWOP, except during initial startup operations described in §250.522;	Industry agrees with the proposed administrative change to update incorrect citations.	None. The proposed change is supported.

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
	(ii) Inability to keep the rig on location; (iii) Repair to major rig or well-control equipment; (iv) Observed flow outside the well's casing (e.g., shallow water flow or bubbling); or (v) Impending National Weather Service-named tropical storm or hurricane. * * * * * (3) If you unlatch the BOP or LMRP: (i) Upon relatch of the BOP, you must test according to §250.734(b)(2), or (ii) Upon relatch of the LMRP, you must test according to §250.734(b)(3); and (iii) You must receive District Manager approval before resuming operations.	While we agree with the revision, we have concerns with the requirement in §250.734(b), incorporated here, to re-test the deadman systems when they have not been repaired or affected by the suspension. It is important to verify that the system is functional, but in cases where the system has not been modified, the previous test should be sufficient. Full discussion of the potential safety risk and proposed alternate text is included below in §250.734(b).	
§250.720(d)	(d) For subsea completed wells with a tree installed, you must have the equipment and capabilities for intervention on those wells. All equipment utilized solely for intervention operations (e.g.. tree interface tools) must be readily available, maintained in accordance with OEM recommendations, and available for inspection by BSEE upon request.	Industry agrees with the inclusion of requirements for the location of required tools for well intervention operations. However, the industry believes the proposed text is overly prescriptive and does not consider the	(d) For subsea completed wells with a tree installed, you must risk assess based on reservoir pressure, MAWHP, production annulus pressure management, and availability of BOP stack with standard intervention kit or develop and maintain a readiness plan that identifies the

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		relative risk of active production wells and operators procedures and pressure management guidelines. Industry recommends that BSEE consider applying the following risk-based context to the subsea wells. 1. Is the reservoir pressure depleted to a pressure below the seawater hydrostatic pressure at the subsea wellhead? If the answer is yes, then sufficient mitigations are in place. 2. Is the well's current Maximum Anticipated Wellhead Pressure (MAWHP) reduced to a pressure below 50% of the initial well MAWHP, and does the operator have the ability to monitor the pressure in the production annulus (A annulus)? If the	equipment, timeline and capabilities for intervention on those wells. Equipment utilized for intervention operations (e.g., tree interface tools) must be identified, available, and maintained in accordance with the readiness plan. The risk assessment or readiness plan must be available for review by BSEE upon request.

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		answer is yes, then sufficient mitigations are in place. 3. Does the well have the ability and the operator's annulus pressure management plan allow the production annulus (A annulus) to be bled to the production system? If the answer is yes, then sufficient mitigations are in place. 4. Can the operator utilize a BOP stack with an industry standard intervention kit (e.g. the Q4000 with IRS), or existing equipment referenced in their well containment plans? If the answer is yes, then sufficient mitigations are in place. If an operator cannot demonstrate at least one of the risk criteria outlined above on an individual well	

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		or field basis, then an operator should develop an Intervention Readiness Plan (IRP). The IRP should address response actions required to respond to a potential release for the specific wells or fields identified. Industry can use the proposed criteria to determine whether sufficient mitigations are in place for individual wells / fields or a Readiness Plan is required. This approach builds on and codifies effective pressure and well management programs existent in industry and ensures operators are ready to intervene, when the risk of an intervention is appropriate.	
§250.722(a)(2)	(2) Report the results of your evaluation to the District Manager and obtain approval of those results before resuming operations. Your report must include calculations that indicate the well's integrity is above the minimum safety factors, if an imaging tool	Industry agrees with the change allowing for continued operations when a successful pressure test	None. The proposed change is supported.

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
	or caliper is used. District Manager approval is not required to resume operations if you conducted a successful pressure test as approved in your permit. You must document the successful pressure test in the WAR.	(as per the permit) is obtained.	
§250.724(a)	(a) No later than April 29, 2019, when conducting well operations with a subsea BOP or with a surface BOP on a floating facility, or when operating in an high pressure high temperature (HPHT) environment, you must gather and monitor real-time well data using an independent, automatic, and continuous monitoring system capable of recording, storing, and transmitting data regarding the following: (1) The BOP control system; (2) The well's fluid handling system on the rig; and (3) The well's downhole conditions with the bottom hole assembly tools (if any tools are installed).	Industry has concerns with the scope of the rule which would result from the adoption of the proposed text. The proposed text would remove an existing boundary in the regulation limiting the scope of §250.724 to Applications for Permits to Drill (APDs). Industry recommends the addition of language defining RTM applications to those operations covered by API Standard 53 to clearly state, consistent with the current regulations and with the incorporation of Standard 53, 4th Edition, with its Addendum 1, which systems must be covered by an Operator's RTM plan. This would provide clarity on scope in the	(a) No later than April 29, 2019, when conducting well operations with a subsea BOP or with a surface BOP on a floating facility, as defined by API Standard 53 incorporated by reference in §250.198(h)(63), or when operating in an high pressure high temperature (HPHT) environment, you must gather and monitor real-time well data using an independent, automatic, and continuous monitoring system capable of recording, storing, and transmitting data regarding the following: (1) The BOP control system; (2) The well's active fluid circulating system; and (3) The well's downhole conditions with the bottom hole assembly tools (if any tools are installed).

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		proposed rule consistent with current regulation. Industry also believes that the existing language in §250.724(a)(2), “well’s fluid handling system on the rig” is potentially unclear as some fluid “handling systems” are not part of the active well barrier. For clarity, industry proposes changing the language to read as “well’s active circulating system”. The industry recommended text relies on standard industry definitions to demonstrate the intent of the current regulations. Additionally, by focusing on the active system, the text of the rule would be aligned with standard industry vernacular for the primary fluid system that is relied on for well control. The most relevant volumes to trend in real time are the active,	

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		collectively the "active system". The current version "well's fluid handling system" could be inadvertently be interpreted as including other systems on the rig such as sand traps, reserve pits, storage pits, and offline volume. In this case, monitoring those systems could make it difficult to differentiate well behavior by diluting the well response over a larger volume and trending data that is not directly connected to the well. Each operator's RTM plan should address managing the monitored pits as the active system on the rig changes. This is commonly managed in industry by the use of the pit volume totalizer (PVT) and flow measurement systems.	
§250.724(b)	Remove existing §250.724(b) and redesignate existing paragraph (c) with minor revisions as paragraph (b).	Industry supports the removal from the rule of the current §250.724(b),	None. The proposed change is supported.

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
	(b) You must develop and implement a real-time monitoring plan. Your real-time monitoring plan, and all real-time monitoring data, must be made available to BSEE upon request. Your real-time monitoring plan must include the following: (1) A description of your real-time monitoring capabilities, including the types of the data collected; (2) A description of how your real-time monitoring data will be transmitted during operations, how the data will be labeled and monitored by qualified personnel, and how the data will be stored as required in §§250.740 and 250.741; (3) A description of your procedures for providing BSEE access, upon request, to your realtime monitoring data; (4) The qualifications of the personnel monitoring the data; (5) Your procedures for, and methods of, communication between rig personnel and the monitoring personnel; and (6) Actions to be taken if you lose any real-time monitoring capabilities or communications between rig personnel and monitoring personnel, and a protocol for how you will respond to any significant and/or prolonged interruption of monitoring capabilities or communications, including your protocol for notifying BSEE of any significant and/or prolonged interruptions.	allowing a greater degree for operators to develop RTM plans consistent with their specific operational risk, their governing principles, and SEMS procedures. Additionally, industry supports the removal of references to "onshore" from the existing rule. These changes retain the risk ownership of the operation and decision-making with the individual Operator.	
§§250.730(a) and (b)	(a) You must ensure that the BOP system and system components are designed, installed, maintained, inspected, tested, and used properly to ensure well control. The working-pressure rating of each BOP component (excluding annular(s)) must exceed MASP as defined for the operation. For a subsea BOP, the MASP must be taken at the mudline. The BOP system includes the BOP stack, control system, and any other associated system(s) and equipment. The BOP system and individual components must be able to perform their expected functions and be compatible with each other. Your BOP system must be	Industry agrees with the proposed change as it aligns the document with existing industry practices proven very successful in Drilling activities worldwide.	None. The proposed change is supported.

	capable of closing and sealing the wellbore in the event of flow due to a kick, including under anticipated flowing conditions for the specific well conditions, without losing ram closure time and sealing integrity due to the corrosiveness, volume, and abrasiveness of any fluids in the wellbore that the BOP system may encounter. Your BOP system must meet the following requirements: (1) The BOP requirements of API Standard 53 (incorporated by reference in § 250.198) and the requirements of §§ 250.733 through 250.739. If there is a conflict between API Standard 53 and the requirements of this subpart, you must follow the requirements of this subpart. (2) The provisions of the following industry standards (all incorporated by reference in § 250.198) that apply to BOP systems: (i) ANSI/API Spec. 6A; (ii) ANSI/API Spec. 16A; (iii) ANSI/API Spec. 16C; (iv) API Spec. 16D; and (v) ANSI/API Spec. 17D. (3) For surface and subsea BOPs, the pipe and variable bore rams installed in the BOP stack must be capable of effectively closing and sealing on the tubular body of any drill pipe, workstring, and tubing (excluding tubing with exterior control lines and flat packs) in the hole under MASP, as defined for the operation, with the proposed regulator settings of the BOP control system. (4) The current set of approved schematic drawings must be available on the rig and at an onshore location. If you make any modifications to the BOP or control system that will change your BSEE-approved schematic drawings, you must suspend operations until you obtain approval from the District Manager.		

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
	(b) You must ensure that the design, fabrication, maintenance, and repair of your BOP system is in accordance with the requirements contained in this part, applicable Original Equipment Manufacturers (OEM) recommendations unless otherwise directed by BSEE, and recognized engineering practices. The training and qualification of repair and maintenance personnel must meet or exceed applicable OEM training recommendations unless otherwise directed by BSEE.		
§250.730(c)	(c) You must follow the failure reporting procedures contained in API Standard 53, (incorporated by reference in § 250.198), and: (1) You must provide a written notice of equipment failure to BSEE, unless BSEE has designated a third party as provided in paragraph (d) of this section, and the manufacturer of such equipment within 30 days after the discovery and identification of the failure. A failure is any condition that prevents the equipment from meeting the functional specification. (2) You must ensure that an investigation and a failure analysis are started within 120 days of the failure to determine the cause of the failure and are completed within 120 days upon starting the investigation and failure analysis. You must also ensure that the results and any corrective action are documented. You must ensure that the analysis report is submitted to BSEE, unless BSEE has designated a third party as provided in paragraph (c)(4) of this section, as well as the manufacturer. (3) If the equipment manufacturer notifies you that it has changed the design of the equipment that failed or if you have changed operating or repair procedures as a result of a failure, then you must, within 30 days of such changes, report the design change or modified procedures in writing to BSEE, unless BSEE has designated a third party as provided in paragraph (c)(4) of this section.	Industry appreciates the additional time provided by the proposed changes (120 days from incident to 120 days from start of the investigation). Industry recognizes that not all failures will require a detailed investigation. However, industry is concerned that extenuating circumstances (operational or investigation related) may prevent the completion of the investigation within 120 days. Industry proposes that the rule provide a method for extending investigations that have been started but are not complete within	(c) You must follow the failure reporting procedures contained in API Standard 53, (incorporated by reference in § 250.198), and: (1) You must provide a written notice of equipment failure to BSEE, unless BSEE has designated a third party as provided in paragraph (d) of this section, and the manufacturer of such equipment within 30 days after the discovery and identification of the failure. A failure is any condition that prevents the equipment from meeting the functional specification. (2) You must ensure that an investigation and a failure analysis are started within 120 days of the failure to

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
	casing landing string, shear sub on subsea test tree, and any electric-, wire-, slick-line in the hole; under MASP. At least one shear ram must be capable of sealing the wellbore after shearing under MASP conditions as defined for the operation. Any non-sealing shear ram(s) must be installed below a sealing shear ram(s).		
§250.734(a)(3)	The accumulator capacity must: (i) Close each required shear ram, ram locks, one pipe ram, and disconnect the LMRP. (ii) Have the capability to perform ROV functions within the required times outlined in API Standard 53 with ROV or flying leads. (iii) No later than April 29, 2021, have bottles for the autoshear and deadman (which may be shared between those two systems) to secure the wellbore. These bottles may also be utilized to perform the secondary control system functions (e.g., ROV or acoustic functions). (iv) Perform under MASP conditions as defined for the operation.	Industry agrees with the proposed change based on alignment with API Std 53, 4th edition, with Addendum 1, and in recognition of its proper application and historical success of Subsea BOP Stacks around the world.	None. The proposed change is supported.
§250.734(a)(4)	The ROV must be capable of closing each shear ram, ram locks, one pipe ram, and disconnecting the LMRP under MASP conditions as defined for the operation. The ROV must be capable of performing these functions in the response times outlined in API Standard 53 (as incorporated by reference in §250.198). The ROV panels on the BOP and LMRP must be compliant with API RP 17H (as incorporated by reference in §250.198).	Industry agrees with removing the open function requirement from the ROV Panel. However, industry is not in agreement with the proposed text requiring that the ROV alone (without flying leads) must be capable of meeting the API S53 timing requirements.	The ROV must be capable of closing each shear ram, ram locks, one pipe ram, and disconnecting the LMRP under MASP conditions as defined for the operation. The ROV must be capable of performing these functions independently, via flying lead or external power source in the response times outlined in API Standard 53 (as incorporated by reference in

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		The text as written does not provide clarity as to whether the timing requirements can be met by the ROV alone or whether the ROV can meet these requirements by using a flying lead as allowed in .734(a)(3)(ii). Industry recommends that the timing requirements align with API Standard 53 and the prior references in the WCR with respect to the ROV capability. Industry is also concerned with BSEE's reference to compliance with API 17H 2nd edition, since API Standard 53 (see section 7.3.20.1.3) already covers this requirement. If the intention of this requirement is to ensure compatibility of all ROVs with all BOP Stack mounted ROV panels, then	§250.198). The ROV panels on the BOP and LMRP must be compliant with API RP 17H (as incorporated by reference in §250.198).

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		adherence to API 17H Type A, B, or C stab receptacles can meet this requirement and are dimensionally the same in both API RP 17H 1st and 2nd Edition.	
§250.734(a)(6)(iv)	(iv) Autoshear/deadman functions must close, at a minimum, two shear rams in sequence and be capable of performing their expected shearing and sealing action under MASP conditions as defined for the operation.	Industry agrees with the proposed change based on alignment with API Std 53 4th edition and proper application / historical success of Subsea BOP Stacks around the world.	None. The proposed change is supported.
§250.734(a)(16)	(16) Use a BOP system that has the following mechanisms and capabilities; If your control pods contain a subsea electronic module with batteries, a mechanism for personnel on the rig to monitor the state of charge of the subsea electronic module batteries in the BOP control pods	Industry agree with the proposed change to remove the existing §§250.734(a)(16)(i) & (ii).	None. The proposed change is supported.
§250.734(b)	(b) If you suspend operations to make repairs to any part of the subsea BOP system, you must stop operations at a safe downhole location. Before resuming operations you must: (1) Submit a revised permit with a verification report from an independent third party documenting the repairs and that the BOP is fit for service; (2) Upon relatch of the BOP, perform an initial subsea BOP test in accordance with § 250.737(d)(4), including deadman in accordance with § 250.737(d)(12)(vi). If repairs take longer than	Retesting the deadman subsea after a successful surface verification is not necessary every time the BOP or LMRP is latched to the wellhead (ex., weather suspensions, disconnect for tubing head spool installation, etc.). Doing so	b) If operations are suspended to make repairs to any part of the subsea BOP system, you must stop operations at a safe downhole location. Before resuming operations, you must:

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
	30 days, once the BOP is on deck, you must test in accordance with the requirements of § 250.737; (3) Upon relatch of the LMRP, you must test according to the following: (i) Pressure test riser connector/gasket in accordance with § 250.737(b) and (c); (ii) Pressure test choke and kill stabs at LMRP/BOP interface in accordance with § 250.737(b) and (c); (iii) Full function test of both pods and both control panels; (iv) Verify acoustic pod communication (if equipped); and (v) Deadman test with pressure test in accordance with §250.737(d)(12)(vi). (4) Receive approval from the District Manager.	presents unnecessary risk to people, asset and the environment. Proposed that deadman retesting subsea only be required when repairs are made to or could impact the deadman circuit. Testing the deadman is not without safety risks (powering down the control system) and should not be done if the test is not necessary.	(1) Submit a revised permit with a verification report from an independent third party documenting the repairs and that the BOP is fit for service; (2) Upon relatch of the BOP, perform an initial subsea BOP test in accordance with § 250.737(d)(4). Deadman test required on surface prior to redeployment and only required subsea if any repairs were made to the deadman circuit; (3) Upon relatch of the LMRP, you must test according to the following: (i) Pressure test riser connector/gasket in accordance with § 250.737(b) and (c); (ii) Pressure test choke and kill stabs at LMRP/BOP interface in accordance with § 250.737(b) and (c); (iii) Full function test of both pods and both control panels;

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
			(iv) Verify acoustic pod communication (if equipped); and (v) Deadman test with pressure test in accordance with §250.737(d)(12)(vi) if any repairs were made to the deadman circuit; and (4) Receive approval from the District Manager.
§250.735(a)	(a) An accumulator system (as specified in API Standard 53 and incorporated by reference in § 250.198). Your accumulator system must have the fluid volume capacity and appropriate pre-charge pressures in accordance with API Standard 53. If you supply the accumulator regulators by rig air and do not have a secondary source of pneumatic supply, you must equip the regulators with manual overrides or other devices to ensure capability of hydraulic operations if rig air is lost;	Industry agrees with the proposed change based on its alignment with API Std 53, 4th edition and proper application / historical success of Subsea BOP Stacks around the world.	None. The proposed change is supported.
§250.736(d)(5)	(5) When running casing, a safety valve in the open position available on the rig floor to fit the casing string being run in the hole. For subsea BOPs, the safety valve must be available on the rig floor if the length of casing being run exceeds the water depth, which would result in the casing being across the BOP stack and the rig floor prior to crossing over to the drill pipe running string;	Industry agrees with the proposed change based on proper application / historical success around the world.	None. The proposed change is supported.
§250.737(a)	BSEE has not proposed revision of this section.	Industry proposes BSEE adopt the 21-day test frequency in conformance with API Std 53, 4th edition. This test period	Revise §250.737(a) to read as follows: (a) *Pressure test frequency.* You must pressure test your BOP system:

Proposed Regulation Reference	Proposed New Regulation Text	Comments	Recommended Industry Text
		ensures reliability of the sealing components and is based on industry studies to determine the appropriate test frequency to achieve the highest reliability considering wear and fatigue on systems. The change does not impact the weekly function test requirement, which is the most reliable determinant of system health.	(1) When installed; (2) Before 21 days have elapsed since your last BOP pressure test, or 30 days since your last blind shear ram BOP pressure test. You must begin to test your BOP system before midnight on the 21st day (or 30th day for your blind shear rams) following the conclusion of the previous test; (3) Before drilling out each string of casing or a liner. You may omit this pressure test requirement if you did not remove the BOP stack to run the casing string or liner, the required BOP test pressures for the next section of the hole are not greater than the test pressures for the previous BOP test, and the time elapsed between tests has not exceeded 21 days (or 30 days for blind shear rams). You must indicate in your APD which casing strings and liners meet these criteria;

<table>
<tr><th>Proposed Regulation Reference</th><th>Proposed New Regulation Text</th><th>Comments</th><th>Recommended Industry Text</th></tr>
<tr><td></td><td></td><td></td><td>(4) The District Manager may require more frequent testing if conditions or your BOP performance warrant.</td></tr>
<tr><td>§§250.737(b) & (c)</td><td>(b) Pressure test procedures. When you pressure test the BOP system, you must conduct a low-pressure test and a high-pressure test for each BOP component (excluding test rams and non-sealing shear rams). You must begin each test by conducting the low-pressure test then transition to the high-pressure test. Each individual pressure test must hold pressure long enough to demonstrate the tested component(s) holds the required pressure. The table in this paragraph (b) outlines your pressure test requirements.
<table>
<tr><th>You must conduct a . . .</th><th>According to the following procedures . . .</th></tr>
<tr><td>(1) Low-pressure test</td><td>All low-pressure tests must be between 250 and 350 psi. Any initial pressure above 350 psi must be bled back to a pressure between 250 and 350 psi before starting the test. If the initial pressure exceeds 500 psi, you must bleed back to zero and reinitiate the test.</td></tr>
<tr><td>(2) High-pressure test for blind shear ram-type BOPs, ram-type BOPs, the choke manifold, outside of all choke and kill side outlet valves (and annular gas bleed valves for subsea BOP), inside of all choke and kill side outlet valves below uppermost ram, and other BOP components</td><td>(i) The high-pressure test must equal the RWP of the equipment or be 500 psi greater than your calculated MASP, as defined for the operation for the applicable section of hole. Before you may test BOP equipment to the MASP plus 500 psi, the District Manager must have approved those test pressures in your permit.
(ii) The blind shear ram (BSR) must be tested to:</td></tr>
</table></td><td>Would like the WCR to be consistent in requirements by a) aligning with testing requirements of API Std 53 and b) allowing the use of alternative pressure testing systems that can determine test validity in less than 5 minutes.

Would like clarity with respect to statement in .737(b) where the text states “…test must hold pressure long enough to demonstrate the tested component(s) holds the required pressure.”

Vs

Section .737(c) where the text states “Each test must hold the required pressure for 5 minutes,…”</td><td>(b) Pressure test procedures. When you pressure test the BOP system, you must conduct a low-pressure test and a high-pressure test for each BOP component. You must begin each test by conducting the low-pressure test then transition to the high-pressure test. Each individual pressure test must be consistent with paragraph (c). The table in this paragraph (b) outlines your pressure test requirements.

(c) Duration of pressure test. Each Subsea BOP system test must hold the required pressure for 5 minutes, which must be recorded on a chart not exceeding 4 hours or a digital recorder. However, for surface BOP systems and surface equipment of a subsea BOP system, a 3-minute test</td></tr>

Questions posed by BSEE related to BOP Equipment and Drilling Margin		
Proposed Regulation Reference	**Proposed Question**	**Recommended Industry Response**
§250.198	<u>API Standard 53 – Edition to Incorporate:</u> At this time, BSEE does not propose to incorporate the API Standard 53 addendum into this proposed rule. However, BSEE is considering incorporating the API Standard 53 addendum in the final rule. BSEE is specifically soliciting comments on whether the API Standard 53 addendum should be included within the documents incorporated by reference. *Please provide reasons for your position. If your comment addresses anticipated monetary or operational benefits associated with using the API Standard 53 addendum, please provide any available supporting data.*	Industry's opinion is that the final rule should incorporate the latest released edition of API Standard 53 at the time of its publishing. In this case this is likely to be API Standard 53 4th Edition with its Addendum 1, issued in July 2016. A large portion of the GOM install base is already in compliance with API Standard 53 4th Edition w/ Addendum & Errata (July 2016). This addendum was compiled, reviewed, and approved by Industry representatives from Operators, Equipment Owners, OEMs, Independent Third Parties, and Service Companies within the API community. The addendum and errata provided clarity to existing text and increases operational safety and reliability. Industry would urge the agency to consider how the 5th Edition of API Standard 53 can be expeditiously incorporated into its regulation once it is published.
§250.730	<u>General req's for BOP systems & components - Failures:</u> Based upon the unknown situations that could arise around the completion of the failure analysis and availability of the equipment, BSEE is specifically soliciting comments about whether specifying a completion date for the failure analysis is appropriate and if so whether 120 days from the commencement of the analysis is appropriate. *Please provide reasons for your position and any applicable associated data.*	We appreciate the additional time provided by the proposed changes (120 days from incident to 120 days from start of the investigation). We recognize that not all failures will require a detailed investigation. However, we are concerned that extenuating circumstances (operational or investigation related) may prevent the completion of the investigation within 120 days. A hard and fast deadline of 120 days may result in conclusions that do not identify the true root cause and ultimately compromise safety.

		Industry proposes that BSEE allow a method for extending the completion dated for investigations that have been started, but are not complete within the 120 days. In such cases, industry suggests the operator submit a status update to BSEE detailing the progress to date and reason(s) as to why the investigation is not completed.
§250.733	<u>Requirements for Surface BOP Stack – Alt Cutting Device:</u> This rulemaking would revise paragraph (a)(1) by removing the reference to an extended time for compliance with exterior control line shearing requirements under the original WCR, which BSEE anticipates will have run and no longer warrant reference in the regulations by the time a final rule is promulgated. BSEE also proposes to remove the requirement to have an alternative cutting device used for shearing electric-, wire-, or slick-line if your blind shear rams are unable to cut and seal under maximum anticipated surface pressure (MASP). The alternative cutting device is no longer necessary because the currently commercially available shear rams have increased design capabilities, which are capable of shearing these types of lines. BSEE is aware of concerns regarding the removal of the alternative cutting device option. Therefore, BSEE is considering other options in the final rule, such as keeping the alternative cutting device provisions in the regulations or extending the compliance date to allow the use of the alternative cutting devices until a more appropriate date when the surface stack shear rams can be upgraded to shear electric-, wire-, or slick-line. A. *BSEE is specifically soliciting comments about the effectiveness of using an alternative cutting device and whether BSEE should continue to allow its use.*	Industry does not concur with BSEE's conclusion that the provisions for alternative cutting devices can be removed "because the currently commercially available shear rams … are capable of shearing these types of lines." While rigs utilizing wire-, electric-, slick-line do have a method for cutting these lines, we wish to clarify that BSEE's statement is not completely accurate as the OEMs do not offer wireline cutting capability for all BOP sizes and rated working pressures currently utilized in the GOM. OEMs do currently offer wireline shear & seal Blind Shear Rams for a range of BOPs, predominately 18-3/4" bore sizes. However, utilizing an 18-3/4" bore BOP is not possible for all applications because of limitations and/or restrictions for weight, size, and configuration. Therefore, we propose that BSEE and Industry work together to discuss the available options and limitations of their use. Industry requests a minimum time period of 5 years from the original release of the WCR for design, testing, manufacture, and installation of the requested Blind Shear Rams for all known bore size and rated working

	B. Additionally, BSEE is also specifically soliciting comments on how long it would take for surface stack shear rams to be upgraded to shear electric-, wire-, or slick-line. Please provide reasons for your position and any applicable associated data.	pressure combinations that are available. Until these Rams are available, Industry will utilize the Alternative Cutting Device referenced in §250.733(a)(1). There are other cutting device solutions that will cut wireline/etc available. As the Cutting Device is part of a system based approach for the Drilling Operation, the regulatory requirement for the Blind Shear Ram and the BOP Stack itself to be the sole device capable of cutting the wireline/etc is restrictive of innovation related to the intent of this requirement.
§250.734	<u>Requirements for Subsea BOP System - Centering:</u> BSEE believes that operators will continue to substitute new components for old ones to comply with the still-required increased shearing capability provisions of the original WCR. BSEE is aware of many technological advancements in shearing ram designs and capabilities. BSEE expects the shear rams to shear pipe or wire in any position within the wellbore; however, BSEE is specifically soliciting comments about the effectiveness of requiring shear rams to center pipe or wire while shearing, or requiring shear rams to have the capability to shear any pipe or wire in the hole without a separate centering mechanism. Another option BSEE is considering is retaining the centering mechanism requirements, but expressly providing that the shear rams with these capabilities satisfy the requirements. *Please provide reasons for your position and any applicable associated data.*	Industry agrees with the proposed rule change to remove the existing §§250.734(a)(16)(i) and (ii). Industry does not believe that that the WCR should provide prescriptive design requirements for the Shear Ram itself: The performance standards for such equipment are adequately addressed in API 16A 4th Edition, which should, along with its subsequent editions, serve as the basis for the agency's regulations going forward.
Section III	<u>Additional Comments Solicited – BOP Testing Frequency</u> *A. BSEE is requesting comments on whether the BOP testing interval should be 7 days, 14 days, or 21 days for all types of operations including drilling, completions, workovers, and decommissioning.*	Propose: <u>A: Testing Duration (7, 14, or 21 days)</u> Industry requests that BSEE align the proposed changes to the Well Control Rule with the 21 day testing interval

	B. BSEE is also requesting comments on the specific cost and operational implications of each testing interval to further its consideration of the issue. The industry and BSEE currently rely on function and hydrostatic tests to verify the performance of BOP equipment in the field. These tests have traditionally been the primary method of verifying the capability of in-service equipment. In recent years, the industry has raised concerns related to the benefits of pressure and functional testing of subsea BOPs when compared to the costs and potential operational issues. BSEE requests comments on the adequacy of the current functional and pressure test requirements in predicting the performance of this equipment in subsequent drilling operations. *C. Under what circumstances or environments should the testing frequency be increased or decreased?* BSEE is aware of potential technologies that may improve the operability and reliability of BOP systems. *D. Are there additional technologies, processes, or procedures that can be used to supplement existing requirements and provide additional assurances related to the performance of this equipment?* *Please provide supporting reasons and data for your responses.*	outlined in API Standard 53 4th Edition (July 2016). This 21 day period has proven to provide assurance of a safe and reliable system without causing premature wear on the equipment. The existing 14 day regulation requirement results in an additional 53% of testing over a 12-month period with a corresponding increase in wear of seals and packers. <u>B: Cost and Operation Implications</u> Previously submitted Joint Trades sponsored Economic Study remains valid for this issue. <u>C: Circumstances or Environments based Frequency</u> Industry believes that the testing frequency of API Standard 53 4th Edition (July 2016) is the optimum requirement for typical worldwide operations. <u>D: Technology, Processes, Procedures for Additional Assurance</u> The 21-day testing period of API Standard 53 (July 2016) aligns with the global practice and capabilities of the existing technology installed and utilized in the GOM. Industry and BSEE recognize that there are technologies that exist, or are in development, that can provide the operator, owner, and OEM with data regarding the equipment's performance. The combination of existing technologies, API Standard 53 failure reporting, and the potential use of emerging technologies may lead to product and process improvements aiding reliability and the goal of further improved safety. As these technologies become more widely proven, Industry will continue to review the test

		frequency requirement within future revisions of API Standard 53.
§250.414	BSEE request comment on replacing it with a more performance-based standard under which the approved safe drilling margin is established on a case-by-case basis for each well.	Industry welcomes the opportunity to propose a performance based standard for the establishment of appropriate safe drilling margins thru the well permitting process. Evaluation and analysis of industry data of wells drilled demonstrates that operators have safely planned and drilled sections of wells below the current default 0.5 ppg drilling margin. The industry has a good track record of using software hydraulic model to plan the working drilling margin required to drill a hole section, and while drilling, actively control downhole wellbore pressure to stay between the pore pressure and the expected shoe pressure integrity test or the lowest estimated fracture gradient. The hydraulic model considers factors such as cutting loads, fluid temperature and composition, drill string and wellbore configuration, drill string rotation speed and flowrates. The hydraulic model is also
§250.414	BSEE also request comment on potentially providing for a different drilling margin or multiple drilling margins that are specific to the conditions in which the wells are drilled, such as if the well is drilling in deep water or shallow water.	
§250.414	BSEE further request comment on whether removal of a specific reference to a 0.5 ppg standard from the regulation may be appropriate.	

§250.414	BSEE also request comment on the criteria that BSEE could use to apply alternative approaches, such as an operator demonstrating that a well is a development well as opposed to an exploratory well.	calibrated to historically related run data. The use of real time downhole pressure while drilling (PWD) tools allows the operator to confirm that the models are correct before drilling out the casing. While drilling the hole section, drilling parameters are actively managed to keep the circulating and static mud density within the drilling margin planned. Since 2010, the available modeling software and computing resource to quickly build accurate models has improved significantly, therefore making the incorporation of this change an improvement in safety by incorporating the latest technology into the regulations. Industry proposes that a Drilling Margin Plan (example template attached) is submitted as part of the permitting process. This plan will outline the drilling margin required for each section based on engineering work using hydraulic models. Industry experience in managing drilling margin risk has demonstrated that the primary safety risk factors are presence of hydrocarbon, potential for flow, and the consequence of losses. A stable column of fluid is a primary well control barrier in drilling operations. Other risks are primarily economic in nature. This engineered approach, consistent with the requirements of the CFR, is applicable in shallow water or deepwater wells and exploration or development wells. There are reasonable situations where margins less than 0.5ppg can be considered safe when considering the full fluid system and the described risk factors. By adopting this approach, operators and BSEE can partner together to ensure the safe drilling margins considerate of all the hole-section specific risks are applied.

		The operator will manage downhole pressures for each section within the approved drilling margin plan. Drilling can continue while the operator can manage downhole ECDs below the shoe pressure integrity test or the lowest estimated fracture gradient for the section. Equivalent downhole mud weight will be kept above the estimated pore pressure. District Manager approval is required if the approved plan cannot be maintained.
§250.414	BSEE request comment on what supplemental data would provide an adequate level of justification for deviating from the 0.5 ppg drilling margin under identified circumstances. Etc……	As specified in comments submitted by industry in reference to §250.414 (c) and as shown on the accompanying spreadsheets, supplemental data could include, hydraulic modeling, related analog well data, seismic data, or risk modeling.
§250.414	BSEE also requests comment on whether there are situations where drilling can continue prior to receiving alternative safe drilling margin approval from BSEE.	Approval to drill ahead with unanticipated losses should be on a case-by-case basis and industry is not requesting departure from going to District Manager for approval. We are unable to identify any specific situations where this would apply, without prior approval when specified within the CDWOP and/or APD. Industry's response is based on the premise that an approval would already exists and the BSEE is seeking information on a situation where any prior approval does not already exist (i.e., contingency lost returns plans are not in place).

§250.414	BSEE request comment on 1) whether there are situations where, despite not being able to maintain the approved safe drilling margin, an operator continued drilling with an alternative drilling margin creates little risk. 2) the criteria that BSEE should use to define those situations and available alternative drilling margins. 3) what level of follow-up reporting (.....) would be appropriate.	Industry has provided comments and recommended text changes for §250.414(c). Industry members believe that should the BSEE accept the proposed text and accompanying spreadsheet details for the Well Control Rule, then, industry could work with the BSEE in further development of an audit process similar to that required for Cementing using the 65-2 document.
§250.414	BSEE is specifically soliciting comments about the effectiveness of the use of related analogous data and how the pore pressure and fracture gradient are determined without related analogous data. Please provide reasons for your position.	Pore pressure and fracture gradients are not determined on GoM wells without the use of some type of related analogous data such as well data, seismic data and/or other geological data. In addition, there are region specific overburden/pore pressure/fracture gradient models and standard work flows used in conjunction with seismic data for regions without any nearby well control. Operators are responsible for identifying the appropriate analogous data for each well and evaluating their applicability.
