L	5/10/2021	Mark E. Rifkin, MS, RDN and Jeanne Blankenship Academy of Nutrition and Dietetics	The Academy of Nutrition and Dietetics (the "Academy") appreciates the opportunity to submit these comments to the Department of Health and Human Services relative to its March 11, 2021 request for comment on the information collection: Access, Exchange and Use of Social Determinants of Health Data in Clinical Notes. Representing more than 107,000 registered dietitian nutritionists (RDNs),1 nutrition and dietetic technicians, registered (NDTRs), and advanced degree nutritionists, the Academy is the world's largest association of food and nutrition professionals and is committed to a vision of a world where all people thrive through the transformative power of food and nutrition. Every day our members provide	Thank you for submitting your comment for the Office of the National Coordinator for Health IT (ONC) <u>Federal Register Notice</u> published March 11, 2021. This message is to advise that your comment is currently being reviewed.
			medical nutrition therapy for patients in clinical, public health, and other settings across the continuum of care, often via telehealth, with the flexibilities necessary due to the COVID-19 public health emergency. The Academy supports this information collection to ensure clinical care practices are optimized for all patients, regardless of demographics. To better promote health equity, it is essential that health care providers understand the relationship between social determinants of health and related costs, utilization, and outcomes, and be able to effectively adjust clinical care practices accordingly. Background The Academy strongly supports the agency's efforts to standardize effective inclusion and application of social determinants of health (SDOH) data in health care. The importance of addressing SDOH has been widely recognized,2 and is endorsed by Healthy People 2020,3 the nation's food and nutrition experts. The RD and RDN credentials have identical meanings and legal trademark definitions.	
			the World Health Organization,4 and the National Partnership for Action to End Health Disparities.5 It is also recognized that behavioral factors, such as physical activity level, diet quality, alcohol intake, and tobacco use contribute substantially to chronic disease risk, management and outcomes and are also influenced by SDOH.6 Thus, SDOH directly affect patients' ability to effectively access culturally-appropriate quality care, and thus are a key driver of costs and health care utilization as well.7 Specific Content Because the United States Core Data for Interoperability is an important mechanism for capturing standardized data elements to support interoperability, the Academy encourages the inclusion of SDOH- related data elements, especially those related to food security. The Academy's support for effective	
			capture of SDOH data is demonstrated by our participation in the Gravity Project, which focuses on identifying the data elements currently available as well as the data elements needed to represent food security and other areas that shape SDOH, such as housing and transportation.8 In addition, the Gravity Project addresses the need to be able to electronically capture and exchange this data across a variety of stakeholders. The interoperability gap can be addressed through the development of standardized guidance providing instructions on how data should be exchanged. Additionally, RDNs are an integral part of the clinical care team and are highly qualified to provide meaningful recommendations to help patients address poor food security. As a result, RDNs could provide unique, valuable data on their capture of SDOH in their clinical notes. Therefore, the Academy respectfully encourages the Department of Health and Human Services to	
			 include RDNs among the health care providers recruited to participate in both the qualitative and quantitative research. include "registered dietitian nutritionist" on the options list of non-physician professionals on page four of Appendix A: Prescreening Questionnaires. 	

			The Academy appreciates your consideration of our comment for the information collection: Access, Exchange and Use of Social Determinants of Health Data in Clinical Notes.	
2	3/26/2021	Carol Graham Leo Pasvolsky The Brookings Institution/ College Park Professor University of Maryland	See Attachment" SDOH Comment 03-26-2021 – Graham" for full comment: In response to the Federal Register notice of March 11, 2021 regarding the inclusion of a Social Determinants of Health component in the clinical notes of Health Providers. As background, I was one of the early "pioners" in the use of well-being in economic analysis and have written numerous books and academic articles on the topic. I have done extensive work on well-being in countries around the world, with a focus on the poor. I also wrote the first paper in economics on what well-being causes, rather than what determines well-being. We showed that happier people were more likely to have better outcomes in the labor market and health arenas five years later ("Does Happiness Pay?" Journal of Economic Behavior and Organization, 2004). Most recently I have done extensive work on despair/Jack of hope among less than college educated whites in the U.S. and show that trends in ill-being - and despair in particular - pre-dated the rise in deaths of despair by over a decade. As such the metrics can serve as warning indicators. We recently built a vulnerability indicator along these lines for states and countries across the U.S. – which now also includes places where COVID mortality and deaths of despair coincide (https://www.brookings.edu/interactives/wellbeing-interactive/). We find that white prime aged males out of the labor force are the most desparate and least healthy group, with high levels of opioid consumption and very low levels of geographic mobility (they do not move to where the jobs are), as well as high levels of anger. This research has been published, most recently, in Science, the Journal of Population Economics, and Social Science and Medicine. Perhaps more relevant, I have been working closely with partners at the Robert Wood Johnson Foundation on the inclusion of well-being metrics and approaches into their Culture of Health prioritics. I was also was a member of a 2011-2012 National Academy of Sciences panel	Thank you for submitting your comment for the Office of the National Coordinator for Health IT (ONC) <u>Federal Register Notice</u> published March 11, 2021. This message is to advise that your comment is currently being reviewed.

Each of these questions would only add 30 seconds to the survey (so a total of 2 minutes of response time)	
would provide a baseline of well-being/ill-being for the participants in your focus groups and might, in the	
end, also be included in the SDOH screening tools that result from them.	
Thanks in advance for your consideration and please feel free to contact me if you have any questions or	
would like to have the exact question phrasing in the event you are interested in using them.

7	3/20/21	Shannon Ramsey Jimenez DO, FACOFP, HPF Sam Houston State University College of Osteopathic Medicine	Thank you for allowing us to comment on this project. As a health policy fellow, I truly understand the need for collection of this data. However, as a physician who practiced in a rural area in a solo practice, I can tell you that requiring physicians to collect this data without paying us enough to be able to afford a social worker to collect it would put a severe burden on already strained small practices and rural clinics. We did our best to work through this problem in my clinic as I wanted to be on the cutting edge of whatever we need to do to help people the best. Here are some barriers.	Thank you for submitting your comment for the Office of the National Coordinator for Health IT (ONC) Federal Register Notice published March 11, 2021. This message is to advise that your comment is currently being reviewed.
			• The cost of another person or persons to collect and input the data.	
			• Once we collect the data, what do we do with it? Physicians are not social workers and are not experts at navigating those systems.	
			 Not all EMRs have a good way to input the data. 	
			 People do not want to share this information with their doctors. They are embarrassed sometimes and are less than honest with us about their situations. 	
			 People do not want to speak their issues out loud to another person, especially in small communities. We found we got more honest answers by giving people an ipad with a questionnaire before they get to the back to the nurse or doctor. This data is important but should be collected by county health departments, or Medicare and Medicaid offices. Federal or state funds can be sent there. Perhaps a partnership where people fill out a survey in the waiting room but the data is input at social services and they contact the person for services, would be the best way to go about this. 	

			When I sold my practice to a university, they were able to hire extra people and had a whole division to handle these things but small groups, private practices, rural and solo docs cannot. Thank you.	
8	3/30/2021	Andrew J. Manos D.O 1760 Termino Suite 222 Long Beach, CA 90804 Board Certified Family Medicine ABOFP Former Director of Medical Education, Pacific Hosp /College Hospital Long Beach Former Family Medicine Director, Pacific Hospital of Long Beach Chair of Family Medicine, Long Beach Memorial Medical Center Chief of Staff Community Hospital of Long Beach	As a practicing physician, I am acutely aware of social determinants of health. From a primary care stand point, we deal with these daily. These determinants include financial issues and abject poverty; more specifically: housing instability, food insecurity (both by access to healthy foods and high food cost in specific areas), transportation access, recreational access, medical care access, mental health care access, and dental care access. The social determinants are related to family support, whether physical, emotional, and/or financial. This support has strained many households with issues of mental health, child care, eldercare, and chemical dependency. Other determinants may or may not be related to poverty. These are underemployment, unemployment, alcoholism, drug addiction, physical and mental abuse. The role of a primary care provider is to identify and communicate with a patient to create a therapeutic relationship. With trust, the patient will provide a medical and social history and an exam necessary to form a plan of care. The plan involves patient education on the condition, the treatment, and the expected result. Care plans and patient encounters may be preventative, therapeutic, or educational. Unfortunately, in the last ten years, the patient-doctor relationship and overall patient satisfaction have eroded by the requirements of aggressive data collection. Benchmarks of meaningful use and preventive measures continue to evolve. The data collection in itself has not improved the quality of care or experience. Moreover, quality measures and many complicated payment schemes have been given to providers to theoretically improve quality care metrics. The question remains: if providers are 100% compliant with meaningful benchmarks, are they in fact mastering quality care or simply mastering the data collection? Additionally, patient nonadherence to a treatment plan or a refusal to consent to a health care screening is held against the provider. Thus, meaningful-use benchmarks cannot be totally mast	Thank you for submitting your comment for the Office of the National Coordinator for Health IT (ONC) Federal Register Notice published March 11, 2021. This message is to advise that your comment is currently being reviewed.
			The implementation of the electronic medical record (EMR) has provided the government with many data points. These metrics include ethnic makeup of practices, drug/alcohol use, compliance with health screenings, hypertension data, BMI data, drug utilization, and disease condition management. The EMR has provided an improvement of tracking medicines, a format for documentation of preventative measures, HEDIS standards for EMR itself, and Health Care Chronic Condition standards. However, it has been an overwhelming effort to produce meaningful data. Other than providing problem lists and medication lists, this data has only verified and affirmed patient nonadherence and noncompliance to medical recommendations to the following: to treatment plans, diet planning, living style change recommendations and reaffirming non-disclosure of high-risk behavior, drug, tobacco and alcohol use by the patient. The data provided by the public to physicians is often inaccurate and unreliable. Patients do not willingly disclose drug use, alcohol use, sexual practices or high-risk behaviors. Many highly skilled clinicians miss these issues.	
			Moreover, the time spent on SDOH data collection will add 10-15% more time to assessments. Imagine all patients answering questionnaires and being queried by health professions with regard to INCOME (Salary, Medicaid, Food stamps, SSI benefits, Medicare, or Pensions), FOOD access (Shopping preferences, locations, convenience, quality and cost), HOUSING issues (rent, mortgage cost, living space, utilities and number in household), and TRANSPORTATION (Public transport, taxi, special vans, ride sharing or walking). These questions will not be answered by most of my patients! Patients will ask: How do these	

			 demeaning and discriminatory. Patients will have the right to refuse and most will, while others will just lie. Thus, the data would be incomplete and unreliable. This SDOH data collection, through the EMR, cannot work and provide accurate data. I assume that questionnaire and collection methods are currently being implemented, as well as service codes, ICD 10 codes and payment designs. This project will fail and the only consequence will be patient alienation and distrust of their providers. The time given to this program will waste clerical resources (paper and time), take away time from patient care, and delay patient access. Other ways of obtaining the necessary data may be more reliable. Many of the population do not seek medical care in an office/ clinic setting. Others use the emergency room as needed, while others refuse all care. Other options for data collection may be mandatory evaluations of SDOH yearly by social workers of Medicaid and aid to dependent family recipients as a start. IRS data on incomes per zip code can be requested. Emergency room data on DUI's, accidental death, overdose deaths and general mortality can be data mined. Presently, meaningful productivity of primary care providers is down, patient satisfaction down and physician burnout is at an all-time high. Concurrently, doctors are spending more time inputting data than interacting with patients. A great portion of the provider interaction involves mandatory documentation requirements and data input. Years of training in medical school and residency continues to be supplanted to regulation and data mining. Young physicians are facing burn out in 5- 10 years. Seasoned physicians look for non-clinical positions, non EMR concierge practices and career changes. Older physicians look to retirement and limiting patient care. Fewer physicians choose primary care due to low pay, lack of patient 		
			 appreciation, and a massive documentation burden. Currently, the physician shortage was inadvertently accelerated by EMR, under the guise of improving care by documentation and data collection. Now it is obvious that out-patient family medicine, internal medicine, and pediatrics are not valued. An excessive burden of SDOH data collection will not provide accurate and complete data. SODH data collection may help to provide data for a MPH or PHD thesis, but it will impair patient care, access to care, and trust. 		
			In closing, the health of our society is deteriorating. Life expectancy has decreased. This is not merely a pandemic statistic. Infant mortality remains high. Early death from alcohol and drugs is skyrocketing. Childhood and adult obesity is epidemic, diabetic prevalence is rising, and cancer related to obesity and/or lifestyle is on the rise.		
			As physicians, we cannot stop poverty, starvation, crime, mental illness, drug addiction, mental, or physical abuse. We cannot stop our own government from policies that do not prosecute specific crimes or that legalize gateway drugs for tax revenue. Primary care physicians discuss safety, health risks, diagnose and treat medical/surgical conditions, share in happiness of family and friends, and console them in death and loss. We can and do provide referrals to resources when they are available, re: temporary housing, food banks, mental health clinics and referrals to adult and child protective services. We are not clergy, not social workers, not lawyers, not police officers, not politicians and not government bureaucrats. As primary care physicians, our mission is to provide quality medical care first, NOT MEANINGLESS DATA MINING.		
9	5/6/2021	Philip Oravetz, M.D. Chief Population	Ochsner Health System (Ochsner) thanks you for the opportunity to comment on OS-0955-New entitled "Access, Exchange and Use of Social Determinants of Health Data in Clinical Notes." We are highly	Thank you for submitting your comment for the Office of the National Coordinator for Health IT	6/9/2

Highway	About Ochsner	
New Orleans, LA	Ochsner, headquartered in New Orleans, is one of the nation's leading integrated not-for-profit academic	
70121	health systems. Ochsner – as a leader in value-based care and delivery system innovation – provides a	
Email:	comprehensive range of services through its clinically integrated network of a combination of owned,	
mbeckstrom@ochsne	managed, and affiliated hospitals, and nearly 200 total sites of care located throughout Louisiana and	
r.org	Mississippi. We are proud that our innovative partnership model through the Ochsner Health Network	
	(OHN) allows many communities to maintain local ownership and control of their hospitals, while bringing	
	to bear the benefit of the experience and breadth of the Ochsner clinical and operational teams. Ochsner	
	offers a wide array of specialized and nationally ranked services with its 4,500 affiliated physicians,	
	including more than 1,600 employed physicians practicing in over 90 specialties and subspecialties, and	
	30,000 employees. Each year Ochsner and its physician partners serve over 1 million individual patients	
	who come from every state in the nation and more than 70 countries. In addition, Ochsner is the largest	
	Medicaid provider in Louisiana and is engaged in vital public-private partnerships, managing safety-net	
	hospitals and physician services in underserved rural and urban communities along with the state's largest	
	combined group of graduate medical education programs.	
	Comments on OS-0955-New	
	Ochsner again thanks you for the opportunity to comment on OS-0955-New. In particular, we respectfully	
	offer the following:	
	1. The United States Core Data for Interoperability (USCDI) should include a data element, which indicates	
	that: (1) the provider has screened the patient for SDOH risk; and (2) the screening identified an SDOH	
	risk/need or no SDOH risk/need.	
	2. The USCDI should include a data element(s) and z-code(s) that identify transportation as a specific SDOH, in addition to other SDOH elements that currently exist such food and housing insecurity.	
	3. To maximize collection of SDOH data elements that Ochsner's experience suggests lead to higher patient	
	needs and health care costs, while at the same time reducing provider reduce burden, we offer detailed	
	recommendations for the USCDI to maintain certain SDOH z-codes and consider eliminating collection of	
	others that currently exist.	
	Ochsner's comments reflect our strong commitment to work with the U.S. Department of Health and	
	Human Services (HHS) and the Office of the National Coordinator for Health Information Technology	
	(ONCHIT) to address patients' SDOH needs, enhance quality of care, improve health outcomes, and lower	
	total costs of care.	
	1. USDCI Element to Screen for SDOH Risk/Need	
	Ochsner respectfully urges the development of a new data element for the USDCI, which indicates that:	
	1. the provider has screened the patient for SDOH risk/need; and	
	2. the screening identified an SDOH risk/need or no SDOH risk/need.	
	Immediately knowing whether or not a patient has an SDOH risk or need meaningfully helps providers	
	during visits deliver more comprehensive and patient-specific care that better accounts for the unique	
	SDOH challenges can lead to optimal health outcomes. Unfortunately, far too often, providers do not know	
	whether or not patients have been screened for SDOH risk/need(s) and whether or not patient-specific	
	SDOH interventions have been implemented to treat those risk/need(s). Thus, to foster more patient-	
	centered care and reduce provider burden, Ochsner respectfully urges the development of a new data	
	element that indicates that the provider has screened the patient for SDOH risk/need, as well as specify	
	whether the screening identified an SDOH risk/need or no SDOH risk/need. The screening should occur	
	somewhat frequently, for example quarterly, so that the most patient data is available to the provider.	

Ochsner wishes to underscore here that we strongly support the movement toward value based care strongly indicates that identifying and addressing patient SDOH neads is critical for success (Providers who address SDOH factors, for example, can help mighter underscary or engency oppartment [ED] visits, Feduce inpatient admissions, and better manage choice diseases, among other critical components. Hence, Cohner extension and 2 Cote for Transportation Access su ans SDOH Risk Cohners extension experiment and a Cote for Transportation Access su an SDOH Risk Cohner extension experiment cannot patient strongly suggests that transportation access is one the three most critical and common SDOH factors impacting our patients. Providers who address	
Ochner strongly believes that hwing a USCD data element indicating SDDM risk/need will meaninghuly contribute to the movement toward more value-based care. 2. USDC Element and 2-Code for Transportation Access as an SDOH Risk. Ochner's extensive experience caring for patients strongly suggests that transportation access is one the three most critical and common SDOH factors impacting our patients. Which suggests that transportation access is on inferior (use in spatients strong) students and to like up rescribed medications from the pharmacy. In addition to these direct medical acre and transmortation addition for the second and index of the strong patients transportation access. 3. Recommended SDOH 2-Codes for Inclusion in the USCDI Ochner extrongly addition to New and addition in the USCDI Ochner appreciates that ONCHIT is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient health outcomes while at the same litem iminizing particular are associated with the eard for inclusion in the USCDI Ochner strongly barries are additivery and patient health outcomes while at the USCI maintain the following specific SDOH z codes, as our experience indicates that these codes in particular are associated with the SOH codes and any experimetry particular are associated with the SOH codes and patient the moles and patient the patients engingue. 1. Education and literary (S50, S51, S53, S54, S53, S64, S53, S64, S75, S97, S98, Housing instability presenses and interacy patients are additivent and additing to prescribed transmert regimens. Education and literary at moles associated with the SOH challenges sub align and adfinating the education and literary - codes.	SDOH factors, for example, can help mitigate unnecessary emergency department (ED) visits, reduce	
 will meaningfuly contribute to the miovement toward more value-based care. 2. USOE Hermet and 2-Code for Transportation Access as nSOH Risk Ochsner's extensive experience caring for patients strongly suggests that transportation access to transportation, our patients cannot atted medical appointments and fixely prescribed medications from the phamaxy. In addition to these direr direct areal care to a transmort effects, lack of stable transportation access also indirectly can negatively impact a patient's employment status and associated financial, housing, and food security. Therefore, Ochsner respectivily urges the development and implementation of a USDCI element(s) and -code(s) to track secure patient transportation access. 3. Recommended SOD AC-codes for Induction in the USCOI Ochsner appreciates that ONCIPI is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient health occess while at the same time minimizing provider burden to the extent practicable. To support this effort, we suggest that the USDCI maintain the following specif. SOOI ccodes, and un reperinder indication and literacy barries present challenges for patients, their families and caregivers, and providers. These barries, for example, can limit patient early compared to the extent practicable. To support this effort, we suggest that the USCI maintain the following specif. SOOI ccodes, and uncervation and literacy barries present challenges for patients, their families and caregivers, and providers. These barries, for example, can limit patient earlier and include that and by the and include that and by the second of the temperity. Therefore, Ochsner suggests maintaining the education and literacy barries are also associated with other SOOI challings such associated transment that and a strong genes cited transment and financial handship the at linked to prove patient heat includes and adverting to anticular are associated and homelesses,	inpatient admissions, and better manage chronic diseases, among other critical components. Hence,	
 2. USCI Element and 2-Code for Transportation Access as an SDOH Risk Ochsner's extensive experience caring for patients strongly suggests that transportation access is one the three most critical and common SDOH factors impacting our patients. Without secure and stable access to transportation, our patients cannot attem medical apportmenters and pick up prescribed medications from the pharmacy, in addition to these direct medical care and treatment effects, lack of stable transportation from the pharmacy, in addition to these direct medical care and treatment effects, lack of stable transportation access. 3. Recommended SDOH 2-Codes for inclusion in the USCI Ochsner appreciates for an expertively increased the transportation access. 3. Recommended SDOH 2-Codes for inclusion in the USCI maintain the toSCI maintain the following specific SDOH 2 codes, so our experience indicates that these and time strong and a stable access. 4. Education and literacy (550, 551, 553, 553, 553, 553, 553, 553, 553	Ochsner strongly believes that having a USCDI data element indicating SDOH screening and SDOH risk/need	
Ochene's extensive experience caring for patients: strongly suggests that transportation access is one the three most critical and common SDOP hators impacting our patients. Without secure and stable access to transportation, our patients cannot attend medical appointments and pick up prescribed medications from the pharmaxy. In addition to these diret medical care and treatment effects, lack of stable transportation access also indirectly can negatively impact a patient's employment attabus and associated financial, housing, and food security. Therefore, Ochener respectively targets that and success that an upper entities that and sociated financial, housing, and food security. Therefore, Ochener respective amonghul data that can be used to drive improvements in care delivery and patient health outcomes while at the same time minimizing provide burden to the extent practicable. To support this effort, we suggest that the USOC maintain the following specific SDOH 2 codes, so or corporation elindates that these codes in particular are associated with the need for increased patient teart in therations of the USO for patients, their families and caregivers, and providers. These barries, for example, can limit patient engagement in healthcare decision-making and adhering to percifice dintements regimens. Education and literacy barries are also associated with other SOOH challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochener suggests maintaining the education and literacy barries are also associated with other SOOH challenges such as employment and financial hardship that are linked to poor patient. Thesing barries presents challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochener specific ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability and paces such as employment and financial hardship that are lin	will meaningfully contribute to the movement toward more value-based care.	
three most critical and common SDOF factors impacting our patients. Without secure and stable access to transportation, or patients, cannot latternd medical appointments and pick up prescribed medications from the pharmary. In addition to these direct medical care and treatment effects, lack of stable transportation access also indirectly can negatively impact a patient's employment status and associated financial, housing, and food security. Therefore, Ochner respectfully urges the development and implementation of a USO element(s) and arcs develop track secure patient transportation access. 3. Recommended SDOH 2-codes for inclusion in the USCD Ochner appreciates that ONCHIT is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient health outcomes while at the same time minimizing provider burden to the extent practicable. To support this effort, we suggest that the USCD maintain the following specific SDOH 2-codes, so or experience indicates that these code is marking and adhering to previde burden to the extent practicable. To support this effort, we suggest that the USCD maintain the following specific SDOH 2-codes, so and interventions and literary barrier spreent chilenges for patient healt enclose (SDOH 2-Codes, SDO 2-SO, SDO 2-SO, SDO 2-SO, SDO 2-SO, SDO 2-SO, SDO 2-SO 2-SO 2-SO 2-SO 2-SO 2-SO 2-SO 2-S	2. USDCI Element and Z-Code for Transportation Access as an SDOH Risk	
transportation, our patients cannot attend medical apportments and pick up prescribed medications from the pharmacy. In addition to these direct medical care and treatment effects, lack of stable transportation access also indirectly can negatively impact a patient's employment status and associated financial, housing, and food security. Therefore, Ochoar respectfully urges the development and implementation of a USOL element(3) and z-code(3) to track secure patient transportation access. 3. Recommended StoDH z-Codes for inclusion in the USOL Ochisner appreciates that ONCHT is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient heat the use store time inminizing provider burden to the extent practicable. To support this effort, we suggest that the USOL maintain the following specific SODH z-codes as our experience indicates that these codes in particular are associated with the need for increased patient care needs and interventions and higher overall healthcare spending. 1. Education and literary (550, 551, 553, 554, 554, 555, 556, 556, 556, 556, coll coll and and financial hardship literacy barries are also associated with other SODH challenges such as employment and financial hardship that are linked to poor patient. Nealth outcomes, Therefore, Otherns suggests maintaining the education and literacy (520, 551, 559, 556, 557, 578, 597, 558, 558, 558, 558, 558, 558, 558, 55	Ochsner's extensive experience caring for patients strongly suggests that transportation access is one the	
the pharmacy. In addition to these direct medical care and restment effects, fack of stable transportation access also inferretly can egatively impact a patient's employment status and associated financial, housing, and food security. Therefore, Ochsner respectfully urges the development and implementation of a USOI clement[3] and z-code(s) to track secure patient transportation access. 3. Recommended SD0H Z codes for inclusion in the USCO Ochsner appreciates that ONCHTT is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient health outcomes while at the same time minimizing provider burden to the extent practicable. To support this effort, we suggest that the USDC maintain the following specific SD0H z codes, as our experience indicates that these codes in particular are associated with the need for increased patient care needs and interventions and higher overall healthcare spending. 1. Education and literacy (550, 551, 552, 558, 558, Education and literacy barriers present challenges for patients, their families and caregivers, and providers. These barriers, for example, can limit patient engagement in healthcare decision such as the refore, Ochsner suggest maintaining the education and literacy 2-codes. 2. Housing (550, 551, 552, 558, 559, 559, 559, 558, 557, 558); Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to caller high-quality treatment and adjutian health outcomes Four opatient. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically usafe and insecure homes; among other housing stability challenges. Without a safe and secure homes; among other housing stability challenges. Without a safe and secure homes; 3. Social support system (602, c03, 604, 605, 608, 66, 630, 631, 631, 631, 634, 635, 636, 637, 6327, 638); Our experience indicates that having a healthy support system with meaningful social connection	three most critical and common SDOH factors impacting our patients. Without secure and stable access to	
 access also indirectly can negatively impact a patient's employment status and associated financial, housing, and food security. Therefore, Ochear respectfully urges the development and implementation of a USOL element(s) and 1-code(s) to track secure patient transportation access. 3. Recommended SDOH Z-Codes for inclusion in the USCDI Ochear appreciates that UNCHIT is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient health outcomes while at the same time minimizing provider burden to the exett practicable. To support this effort, we suggest that the USDCI maintain the following specific SDOH z codes, as our experience indicates that these codes in particular are associated with the need for increased patient care needs and interventions and higher overall healthcare spending. 1. Education and literary (55.0, 55.1, 55.3, 55.3, 55.8): Education and literary barriers present challenges for patients, their families and caregivers, and providers. These barriers, for example, can limit patient engagement in healthcare decision-making and adhering to procercibed treatment regimes. Education and literary barriers are also associated with other SDOH challenges such as employment and and dipating that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literary barriers. 2. Housing (59.0, 59.1, 59.2, 59.4, 59.5, 59.6, 59.7, 59.8): Housing instability represents one of the three most Important SDOH factors that Impacts Ochaner's ability to deliver high-quality treatment and optimal health outcomes for our patient. Housing instability presents itself in visuo forms, ranging from: uncertain ability to make rent or mortgage payments; physically usafe and increased means; among other housing security z-codes. 3. Social support system (SOL, 60.8, 65.0, 60.8, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support	transportation, our patients cannot attend medical appointments and pick up prescribed medications from	
 housing, and food security. Therefore, Ochaer respectfully urgs the development and implementation of a USDC element(s) and z-ode(s) to track secure optient transportation access. 3. Recommended SDOH Z-Codes for Inclusion in the USCDI Ochaer appreciates that DNCHT is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient health outcomes while at the same time minimizing provider burden to the extent practicable. To support this effort, we suggest that the USDCI maintain the following specific SODH z codes, so ure experience indicates that these codes in particular are associated with the need for increased patient care needs and interventions and higher overall healthcare spending. 1. Education and literary (SD.5, S.15, S.5, S.5, S.5, S.5, S.8). Education and literare vbarries present challenges for patients, their families and caregivers, and providers. These barriers, for example, can limit patient engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literary barries are also associated with other SDOH challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochaer suggests maintaining the education and literary codes. 2. Housing (S90, S91, S92, S94, S95, S96, S97, S9.8): Housing instability represents one of the three most important SDOH factors that impacts Ochaers's sublity to delive thigh-quality treatment and optimal health outcomes for our patients. Housing instability presents there and insecure homes; environmentally unsafe and uncean living space affected by torius such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security -zcodes. 3. Social support system (S02, S05, S05, S05, S0	the pharmacy. In addition to these direct medical care and treatment effects, lack of stable transportation	
 a USDC element(s) and z-code(s) to track secure patient transportation access. 3. Recommended SDDR Z-codes for Inclusion in the USCD Ochsner appreciates that ONCHIT is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient health outcomes while at the same time minimizing provider burden to the extent practicable. To support this effort, we suggest that the USDC maintain the following specific SDOH z codes, as our experience indicates that these codes in particular are associated with the need for increased patient care needs and interventions and higher overall healthcare specing. 1. Education and literacy (55.0, 55.1, 55.3, 55.4, 55.8); Education and literacy barriers present challenges for patients, their families and caregivers, and providers. These barriers, for example, can limit patient engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literacy barriers are also associated with other SDOH challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literacy barriers are also associated with other SDOH challenges such as employment and financial hardship that are linked to poor patient hashib outcomes's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents lised if uvarious forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and indensecure homes; environmentally unsafe and uncellan living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner suggests maintaining the accellance since adule secure and ability to adhere to pr	access also indirectly can negatively impact a patient's employment status and associated financial,	
 3. Recommended SDOH 2-Codes for Inclusion in the USC 1 Ochsner appreciates that ONCHIT is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient health outcomes while at the same time minimizing provider burden to the extent practicable. To support this effort, we sugges that the USDC Imaintain the following specific SDOH 2-codes, so our experience indicates that these codes in particular are associated with the need for increased patient care needs and interroy torisor present challenges. 1. Education and literary (Sto, 55.1, 55.3, 55.4, 55.8). Education and literary barries present challenges for patients, their families and caregivers, and providers. These barries, for example, can limit patient engagement in healthcare decision-making and adhering to prescribed treatment regimes. Education and literary 2-codes. 2. Housing (59.0, 59.1, 59.2, 59.5, 59.5, 59.7, 59.8). Housing instability represents one of the three most important SDOH factors that impact to chare's ability to oliver high-quality treatment and optimal health outcomes for our patients. Housing instability represents lisefil norus forms, ranging from: uncertain ability to make rend to mortgage payments; physically unsafe and insecure housing; environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsener recomment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsener recomment, many patients is critical schedules, 60.6, 60.8, 63.6, 63.6, 63.7, 63.7, 63.7, 63.7, 63.7, 63.8); Our experience indicates that having a healthy support system (06.5, 60.8, 63.6, 63.7, 63.7, 63.7, 63.7, 63.7, 63.8); Our experience indicates that having a healthy support system (05.6, 60.8, 63.6, 63.6, 63.7, 63.7, 63.7, 63.7, 63.8); Our experience indicates that having a healthy support system (05.6, 60.8, 63.6, 63.6, 63.6, 63.7, 63.7, 63.7, 63.7, 63.7, 63.8); Our experien	housing, and food security. Therefore, Ochsner respectfully urges the development and implementation of	
Ochsner appreciates that ONCHIT is considering methods to collect meaningful data that can be used to drive improvements in care delivery and patient health outcomes while at the same time minimizing provider burden to the extent practicable. To support this effort, we suggest that the USDCI maintain the following specific SDOI z codes, as our experience indicates that these codes in particular are associated with the need for increased patient care needs and interventions and higher overall healthcare paending. 1. Education and literacy (55.0, 55.1, 55.3, 55.4, 55.8). Education and literacy barriers present challenges for patients, their families and acregivers, and providers. These bandle, can liting traitent engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literacy barriers are also associated with other SDOI challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the ducation and literacy 2-codes. 2. Housing (50.0, 59.1, 59.2, 59.4, 59.5, 59.6, 59.7, 59.8); Housing instability represents one of the three most important SDOIH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environment, many patients simply cannot adhere to prescribed duct by toxin such as lead paint; and homelessness, armong other housing satality reades. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8, 63.6, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.7, 63.72, 63.8); Our experience indicates that having a healthy support system with meaningful social support system, for example, patients to have the necessary confidence and ability to adhere to prescribed treatment and care reg	a USDCI element(s) and z-code(s) to track secure patient transportation access.	
drive improvements in care delivery and patient health outcomes while at the same time minimizing provider burden to the extent practicable. To support this effort, we suggest that the USDCI maintain the following specific SDOH z codes, as our experience indicates that these codes in particular are associated with the need for increased patient care needs and interventions and higher overall healthcare spending, 1. Education and literarcy (55.0, 55.1, 55.3, 55.3); Education and literarcy barriers present challenges for patients, their families and caregivers, and providers. These barriers, for example, can limit patient engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literarcy barriers are also associated with other SDOH challenges such as employment and financial hardShip that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literarcy z-codes. 2. Housing (590, 591, 592, 594, 595, 596, 597, 598): Housing instability presents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments: physically unsafe and paint; and homelessness, among other housing stability challenges. Without a asfe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8, 63.0, 63.1, 63.1, 63.3, 63.4, 63.5, 63.7, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and baility to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patie	3. Recommended SDOH Z-Codes for Inclusion in the USCDI	
 provider burden to the extent practicable. To support this effort, we suggest that the USDCI maintain the following specific SDOH z codes, as our experience indicates that these codes in particular are associated with the need for increased patient care needs and interventions and higher overall healthcare spending. 1. Education and literacy (55.0, 55.1, 55.3, 55.4, 55.8). Education and literacy barriers present challenges for patients, their families and caregivers, and providers. These barriers, for example, can limit patient engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literacy barriers are also associated with other SDOH challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literacy barriers are also associated with other SDOH challenges usuch as employment and financial hardship that are linked to poor patient. Housing instability treatments is usefin availous forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space and secure home environment, many patients simply cannot abhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.6, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.7, 63.7, 63.8); Our experience indicates that having a healthy support system with meaningful solaid connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treas, among other housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.7, 63.7, 63.8); Our experience indicates that having a healthy support system. 4. Employment (56.0, 56.1 56.3, 56.6, 56.8, 56.81); Lack of secure and	Ochsner appreciates that ONCHIT is considering methods to collect meaningful data that can be used to	
 following specific SDOH z codes, as our experience indicates that these codes in particular are associated with the need for increased patient care needs and interventions and higher overall healthcare spending. 1. Education and literacy (55.0, 55.1, 55.3, 55.4, 55.8): Education and literacy barriers present challenges for patients, their families and caregivers, and providers. These barriers, for example, can limit patient engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literacy barriers are also associated with other SDOH challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literacy tocates. 2. Housing (59.0, 59.1, 59.2, 59.4, 59.5, 59.6, 59.7, 59.8): Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability to toliver high-quality treatment and optimal health outcomes for our patients. Housing instability to toliver high-quality treatment and optimal health outcomes for our patients. Housing instability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability pusses and is lead pairt, and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (602, 60.3, 60.4, 60.5, 60.8, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.7, 63.8); Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens. Thave and a pating security z-codes. 4. Social support sy	drive improvements in care delivery and patient health outcomes while at the same time minimizing	
 with the need for increased patient care needs and interventions and higher overall healthcare spending. 1. Education and literacy (550, 551, 553, 554, 550). Education and literacy barriers present challenges for patients, their families and caregivers, and providers. These barriers, for example, call minit patient engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literacy barriers are also associated with other SDOH challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literacy z-codes. 2. Housing (590, 591, 592, 594, 595, 596, 597, 59.8). Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homees; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. Social support system (602, 603, 604, 605, 608, 66, 630, 633, 633, 633, 633, 633, 637, 637, 637	provider burden to the extent practicable. To support this effort, we suggest that the USDCI maintain the	
 1. Education and literacy (55.0, 55.1, 55.3, 55.4, 55.3); Education and literacy barriers present challenges for patients, their families and caregivers, and providers. These barriers, for example, can limit patient engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literacy barriers are also associated with other SDOH challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literacy z-codes. 2. Housing (50.0, 59.1, 59.2, 59.4, 59.5, 59.6, 59.7, 59.8); Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.3, 63.4, 63.3, 63.5, 63.6, 63.7, 63.72, 63.8); Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.5, 56.	following specific SDOH z codes, as our experience indicates that these codes in particular are associated	
for patients, their families and caregivers, and providers. These barriers, for example, can limit patient engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literacy z-codes. 2. Housing (59.0, 59.1, 59.2, 59.4, 59.5, 59.6, 59.7, 59.8): Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security 2-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed tireat, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.5,	with the need for increased patient care needs and interventions and higher overall healthcare spending.	
 engagement in healthcare decision-making and adhering to prescribed treatment regimens. Education and literacy barriers are also associated with other SDOH challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literacy z-codes. Housing (59.0, 59.1, 59.2, 59.4, 59.5, 59.6, 59.7, 59.8): Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and incecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. Employment (56.0, 56.1, 56.3, 55.8, 56.8, 58.8): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, housing stability, childcare stability, and other SDOH factors. Ou	1. Education and literacy (55.0, 55.1, 55.3, 55.4, 55.8): Education and literacy barriers present challenges	
 literacy barriers are also associated with other SDOH challenges such as employment and financial hardship that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literacy -codes. Housing (59.0, 59.1, 59.2, 59.4, 59.5, 59.6, 59.7, 59.8): Housing instability repersents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients con face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. Employment (56.0, 56.1, 56.3, 56.5, 56.8, 56.8): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these 	for patients, their families and caregivers, and providers. These barriers, for example, can limit patient	
 that are linked to poor patient health outcomes. Therefore, Ochsner suggests maintaining the education and literacy z-codes. 2. Housing (50, 591, 592, 594, 59.5, 59.6, 59.7, 59.8): Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.7, 63.7, 63.7, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.8, 56.8): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these 		
 and literacy z-codes. 2. Housing (59.0, 59.1, 59.2, 59.4, 59.5, 59.6, 59.7, 59.8): Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to delive high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.5, 56.5, 56.1): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patient' food access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these 		
 2. Housing (59.0, 59.1, 59.2, 59.4, 59.5, 59.6, 59.7, 59.8): Housing instability represents one of the three most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8, 63.6, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system the meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.5, 56.6, 58.3, 58.1): Lack of secure and stable employment directly impacts patients', finduid security and thus also affects patients' food access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these 		
most important SDOH factors that impacts Ochsner's ability to deliver high-quality treatment and optimal health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.5, 56.5, 56.8, 56.8, 51): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, transportation access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these		
 health outcomes for our patients. Housing instability presents itself in various forms, ranging from: uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.5, 56.6, 58.5, 56.81): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, transportation access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these 		
 uncertain ability to make rent or mortgage payments; physically unsafe and insecure homes; environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1 56.3, 56.5, 56.6, 56.8, 56.81): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these 		
 environmentally unsafe and unclean living space affected by toxins such as lead paint; and homelessness, among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.5, 56.6, 56.8, 56.81): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, transportation access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these 		
 among other housing stability challenges. Without a safe and secure home environment, many patients simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.5, 56.6, 56.8, 56.81): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, transportation access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these 		
simply cannot adhere to prescribed medical treatment and care regimens. Therefore, Ochsner recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1 56.3, 56.5, 56.68, 56.81): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, transportation access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these		
recommends keeping the housing security z-codes. 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.6, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1 56.3, 56.5, 56.6, 56.8, 56.81): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, transportation access, housing stability, childcare stability, and other SDOH factors. Our experience indicates that each of these		
 3. Social support system (60.2, 60.3, 60.4, 60.5, 60.8 63, 63.0, 63.1, 63.3, 63.4, 63.5, 63.7, 63.72, 63.8): Our experience indicates that having a healthy support system with meaningful social connections is critical for patients to have the necessary confidence and ability to adhere to prescribed treatment and care regimens that lead to optimal health outcomes. Without an adequate social support system, for example, patients can face challenges eating well, exercising, taking medications at prescribed times, amongst many other activities necessary to achieve optimal health and well-being. Consequently, Ochsner suggests maintaining the z-codes for social support systems. 4. Employment (56.0, 56.1, 56.3, 56.5, 56.6, 56.8, 56.81): Lack of secure and stable employment directly impacts patients' financial security and thus also affects patients' food access, transportation access, housing stability, childcare stability, and other SDOH factors. 			Conclusion In conclusion, Ochsner again thanks you for the opportunity to comment on OS-0955-New. We very much appreciate your leadership on this important initiative to address patients' SDOH needs and ameliorate health disparities across our Nation. We are eager to serve as a resource to you and your staff as you continue your work on these and other health policy matters.	
			 amongst others, that can make it difficult for them to thrive in society and suffer from poor health outcomes. Hence, Ochsner suggests maintaining the z-codes for civil and criminal legal issues. 9. Lifestyle (72.0, 72.3, 72.4, 72.5, 72.6, 72.8): Ochsner's experience indicates that lifestyle factors such as lack of exercise, unhealthy diet and eating habits, tobacco use, high risk sexual behavior, gambling and betting problems, and others directly link to negative patient health outcomes. We therefore recommend keeping the z-codes tracking patient lifestyle choices. 	
			8. Civil and criminal legal issues (65.0, 65.1, 65.2, 65.4, 65.5, 65.8): Individuals confronting civil, criminal, or other legal challenges such as current or past imprisonment face a host SDOH challenges that others without such challenges often do not encounter. These individuals can experience problems with employment stability, housing stability, financial insecurity, transportation instability, and food insecurity,	
			health outcomes.1 2 3 For example, ACEs contribute to a significantly higher risk and likelihood in individuals suffering from depression, chronic obstructive pulmonary disease (COPD), asthma, heart disease, and obesity/excess weight. ACEs also contribute to unhealthy behaviors such as smoking and heavy consumption of alcohol. As such, Ochsner recommends keeping the z-codes for ACEs.	
			 codes associated with patient stress and social challenges. 1514 Jefferson Highway • New Orleans, LA 70121 • phone (504) 842-3000 • ochsner.org P a g e 5 7. Adverse childhood experiences (ACEs) (62, 62.0, 62.2, 62.21, 62.22, 62.6, 62.8, 62.810, 62.811, 62.812, 62.813, 62.819, 62.82, 62.89): Published research has shown that ACEs directly correlate with patient 	
			hinder patients' ability to maintain a healthy and beneficial social support system, which, as stated above, is important for encouraging patients to perform and maintain prescribed medical and care recommendations necessary for optimal health outcomes. As such, Ochsner suggests maintaining the z-	
			shown that occupational and environmental exposure can directly influence patient health outcomes. Such is likely the case for certain other industries and occupations across the U.S. Consequently, we suggest maintaining the z-codes for occupational and environmental exposure. 6. Stress and social challenges (73.0, 73.2, 73.3, 73.4, 73.5): Acute and chronic stress and social challenges	
			5. Occupational and environmental exposure (57.0, 57.1, 57.2, 57.3, 57.31, 57.39, 57.4, 57.5, 57.6, 57.7, 57.8, 57.9): Ochsner's experience caring for patients employed by the oil and gas industries in particular has	

individual (both on- and off-Exchange), small group, and large group markets, we look forward to	
working with HHS to identify data elements reflecting Social Determinants of Health (SDOH) for future	
inclusion in the United States Core Data for Interoperability (USCDI).	
Standardization across Screening Tools is Necessary to Reduce Administrative Burden and Improve	
Patient Health Outcomes.	
Although the USCDI's standardized set of health data classes and data elements facilitate important	
interoperable health information exchange, data reflecting SDOH – the conditions in which people live,	
learn, work, and play – is much more limited. There is a growing recognition that by capturing,	
accessing, and sharing SDOH data during the course of care and treatment, providers can more easily	
address non-clinical factors such as food insecurity, housing instability, and transportation.	
2	
- National standards related to SDOH are needed to resolve inconsistencies and avoid gaps in patient	
histories when they move among healthcare and social service providers. Population health is at risk	
when patients do not receive appropriate and effective care and treatment due to misaligned clinical	
decision support tools. The lack of standards also creates an administrative burden since critical data	
cannot be efficiently shared among providers using different health record systems.	
Furthermore, SDOH standards are necessary for payers and providers to collect and share interoperable	
SDOH data for research and analytics that would document and support efforts to provide greater	
technical and financial resources to the critically important Community Based Organizations (CBOs). This	
would ensure robust CBO participation in the healthcare ecosystem.	
Anthem Supports the Health Level Seven (HL7) Gravity Project's Submission to Include SDOH in the	
USCDI, Version 2 (v2), for Better Care and Better Health Nationwide.	
ONC developed a revised USCDI expansion process, which established the ONC New Data Element and	
Class submission system, used by stakeholders to submit data elements and classes to be considered for	
future versions of USCDI. Consistent with the revised expansion process, the industry-led Gravity Project	
submitted two alternative proposals1 to include SDOH in USCDI v2:	
Submission 1: New SDOH data class, organized by SDOH functional domains to reflect diverse factors	
that affect health status; and,	
I Submission 2: New SDOH data class, organized by SDOH activities in clinical care.	
Regardless of whether ONC includes the SDOH data class and data elements defined, respectively, in	
Submission 1 or Submission 2, the Gravity Project frames a consistent approach to defining data	
elements and supporting terminologies and value sets necessary to describe priority social domains	
across core healthcare activities.	
Documenting and sharing SDOH-related assessment, diagnosis, and treatment information using coding	
and data exchange standards has the potential to improve whole person health and well-being, as well	
as health outcomes. Social and environmental factors impact both individual and population health. As	
highlighted by the COVID-19 pandemic, the delivery of traditional healthcare accounts for just a small	
percentage of health. Providers, payers, and vendors are now recognizing this in their adjustments to	
care coordination and related data collection. Both of the Gravity Project's proposals would add critical	
domains such as food insecurity, housing instability, transportation insecurity, social isolation, and stress	
to the USCDI. These domains would be integrated into core clinical activities such as assessments,	
diagnoses, interventions, and outcomes.	
1 The Gravity Project's Submission To Include Social Determinants of Health in the U.S. Core Data for	
Interoperability, Version 2,	
for Better Care and Better Health Nationwide, dated October 23, 2020. Accessed at	
https://www.healthit.gov/isa/sites/isa/files/webform/uscid_webform/1701/Gravity%20Project%20to%20	
ONC%20on%20SDOH	

			%20Data%20Class%20for%20USCDI%20v2%20%2810-23-2020%29.pdf 3 Anthem is focused on improving the health and well-being of the communities we serve by focusing on all health indicators, including SDOH, to help every individual address barriers to healthcare and overall health and well-being. A standards-based integration of SDOH data into USCDI v2 is critical to this mission. The inclusion of SDOH as a new data class in the USCDI would support the policy objectives of HHS that focus on improving the experience of care, improving the health of populations, and avoiding unnecessary costs in healthcare. We value the partnership that we have developed with HHS and welcome the opportunity to discuss our recommendations for including SDOH data in the USCDI v2. Should you have any questions or wish to discuss our comments further, please contact Lisa Watkins at (202) 508-7889, or lisa.watkins2@anthem.com.	
11	5/10/2021	Samantha Burch American Hospital Association	On behalf of the American Hospital Association's (AHA) nearly 5,000 member hospitals, health systems and other health care organizations, our clinician partners – including more than 270,000 affiliated physicians, 2 million nurses and other caregivers – and the 43,000 health care leaders who belong to our professional coordinator for Health IT (ONC) on the exchange and use of social determinants of health (SDOH) data. Hospitals and health systems are working to address their patients' social needs and the broader SDOH in the communities they serve. This includes societal and environmental conditions such as food, housing, transportation, education, violence, social support, health behaviors and employment. Robust data related to patients' social needs is critical to hospitals' efforts to improve the health of their patients and communities, and we appreciate the ONC's consideration of how best to leverage certified electronic health records (EHR) as a tool to advance health equity. The AHA supports the addition of data classes and elements to future versions of the U.S. Core Data for Interoperability (USCDI) that will enable standardized capture of SDOH. EHRs can be an important tool to support collection of these data necessary to gain key insights at the patient and population health levels and build data-driven interventions. Yet, many of the challenges in collecting these data ne not technical in nature, but rather stem from the need to create a value proposition for patients to share highly personal information and provide training and resources to support these lengaing directly with patients in data collection. Additionally, the proliferation requests to collect and share SDOH data in non-standard ways adds complexity and duplication for health care providers as well as for patients. As the ONC considers the future direction of its work to support the collection, access and exchange of SDOH data, including through expansion of the USCDI, we make the following suggestions: Prioritize Technical Infrastruc	Thank you for submitting your comment for the Office of the National Coordinator for Health IT (ONC) <u>Federal Register Notice</u> published March 11, 2021. This message is to advise that your comment is currently being reviewed.

			encourage ONC to create a roadmap for adoption of expanded versions of the USCDI in regulation that lays out a clear process for collecting and incorporating feedback from end-users. Continue Investments in Real-World Testing. As ONC works across the Department of Health and Human Services (HHS) and with the private sector in its health IT coordination role, we encourage a strong focus on real-world testing of technology solutions to support SDOH data exchange in defined use cases. The AHA was pleased to see that ONC will be funding work related to referral management to address SDOH as part of the Leading Edge Acceleration Projects (LEAP) in Health IT in FY2021. This investment in piloting health IT standards and non-proprietary approaches for managing care referrals for social services and support is needed to test and advance exchange of electronic information across health care and community-based organizations. We encourage ONC to continue to support innovations in technology that enable collaboration between organizations to address the social risks of the individuals served commonly across settings. Findings from these ONC-funded projects should be widely disseminated to support the field in scaling bi-directional SDOH data exchange efforts.	
12	5/10/2021	MaryAnne Lindeblad, BSN, MPH Washington State Health Care Authority	The Washington State Medicaid Agency (SMA), the Health Care Authority (HCA), submits the following comments in response to the March 11th U.S. Department of Health and Human Services (HHS), Office of the Secretary (OS), Office of the National Coordinator for Health Information Technology (ONC) Request for Comment (RFC) on access, exchange and use of Social Determinants of Health Data (SDOH) in clinical notes. Comments are due by May 10th. Background: In the Information Collection Request (ICR), HHS states that: • access, exchange and use of health information is essential to better manage patient health care needs and share information with providers and caregivers; and • many hospitals and physicians possess capabilities that enable patients to view and download their health information, yet additional steps are needed to make health information more accessible and useful to both clinicians and patients. HHS requests comments on the burden estimates included in the RFC and on any other aspect of the ICR, including on the following subjects the: 1. necessity and utility of the proposed information collection for the proper performance of the agency's functions; 2. accuracy of the estimated burden; 3. ways to enhance the quality, utility, and clarity of the information to be collected; and 4. use of automated collection techniques or other forms of information technology to minimize the information collection burden. HCA Comments: The Washington State Medicaid Agency (SMA), the Health care Authority (HCA), offers the following comments regarding the ICR entitled, "Access, Exchange and Use of Social Determinants of Health Data in Clinical Notes (Document identifier 0955–New–60D)". The HCA agrees, as described in the ICR, that: • access, exchange and use of health information is essential to better manage patient health care needs and share information with providers and caregivers; • many hospitals and physicians possess capabilities that enable patients to view and download their health information; and • additi	Thank you for submitting your comment for the Office of the National Coordinator for Health IT (ONC) <u>Federal Register Notice</u> published March 11, 2021. This message is to advise that your comment is currently being reviewed.

As a result, the ability of these providers to "access, exchange and use of health information" including	
SDOH data is significantly limited as is the ability to manage patient health care needs and share	
information with other providers, patients, and caregivers is limited.	
Comment: We recommend that Federal Government, including ONC and CMS, implement programs to	
support the adoption and use of interoperable technology by behavioral health providers, long-term care	
providers and community-based organizations and that such technologies support the creation, exchange,	
and use of SDOH data. For example, programs could include:	
• financial incentives for these providers to adopt and use interoperable technology; and/or	
• grants to states making available an enhanced federal match (e.g., 90/10) to design, develop, and	
implement programs for these providers to adopt and use interoperable technologies.	
2. The United States Core Data for Interoperability (USCDI) Version 1 (v1) is limited in terms of included	
SDOH data. Content in the USCDI is referenced in the ONC EHR certification criteria. However, the ONC EHR	
certification criteria lacks needed specificity to support the interoperable creation, exchange, and re-use	
SDOH data.	
The Gravity Project has identified the following codes sets for the following activities:	
Comment: We recommend that ONC include in the USCDIv2 the:	
(i) SDOH data class and the domains identified by the Gravity Project (i.e., screening, diagnosis, goal setting,	
and interventions (including referrals));	
(ii) specific terminologies (i.e., LOINC, SNOMED-CT, and ICD-10-CM) identified by the Gravity Project for the	
SDOH domains; and	
(iii) update future versions of the USCDI as additional SDOH domains and linked terminologies are	
identified via the Gravity Project and published by terminology coding stewards.	
3. There is a growing body of literature regarding the value of collecting and using SDOH data to identify	
and address risks for individuals and populations, the relationship between SDOH domains and health care	
costs, and interventions and strategies to address these risks1,2,3. For example:	
Food Insecurity: Food insecurity has been linked in several studies to poor outcomes and higher costs. For	
example, a 2014 study of low-income diabetic persons found "a cyclic pattern of hospitalizations for	
hypoglycemia, with rates of hospitalization steadily increasing throughout the course of a month and	
peaking at the end of the month suggesting that the increase in hypoglycemia-related hospital	
admissions among low-income individuals at the end of the month occurs concurrently with the exhaustion	
of food budgets at the end of the month."	
A large national insurer focused on food insecurity and offered Supplemental Nutrition Assistance Program	
(SNAP) benefits to purchase food to members who screened positive for food insecurity. The insurer	
reported that the number of days those patients were either physically or mentally not well were cut in	
half, reducing the insurer's per member per month (PMPM) costs.	
 Transportation Insecurity: A health care delivery system reported reducing its PMPM spending (from 	
\$2,800 to \$1,300) by increasing access to office visits by providing a (non-billable) transportation benefit to	
persons with diabetes and realizing a reduction in hospital admissions for this population.	
Homelessness and Housing Instability: Research shows that: (1) (a) homelessness is associated with	
increased hospital and emergency department admissions, and (b) housing instability is associated with	
postponing needed medical care and increased use of emergency department and hospital services; and (2)	
addressing housing needs can result in significant reductions in hospitalizations and emergency department visits.	
The preceding examples suggest many of the complexities and challenges of efficiently capturing and using	
SDOH data, including the need for:	
• Provider and payer systems to connect with social service programs and systems to exchange and (re)use	
SDOH data.	

	• Multiple systems (e.g., used by payers and providers across the care continuum) to create, receive and	
	(re)use SDOH data for multiple purposes (e.g., screening/assessment, diagnosis, goal setting, interventions,	
	referrals, and analytics).	
	• Systems linkages between health care providers/payers and non-healthcare data sources (e.g., social	
	service programs such as TANF, SNAP).	
	Efficient collection of SDOH data at the point care and (re)using this data to improve individual and	
	population level outcomes, and decrease costs will require that providers, payers, and programs have and	
	use automated collection techniques or other forms of information technology to:	
	minimize the information collection burden;	
	• support information exchange between providers (i.e., health care, behavioral health, and social service	
	providers), payers, and programs; and	
	• enable analytics to monitor and improve patient-level outcomes and manage population health.	
	However, as noted above, many providers across the care continuum lack needed technology to access,	
	exchange and use of health information, including SDOH data.	
	Further, while we applaud and appreciate the essential work that the Gravity Project is undertaking (e.g.,	
	identifying code sets for SDOH domains and data elements), we do not believe this is sufficient to support	
	and increase the collection and use of SDOH data.	
	In January 2020, CMS published a report entitled, "Z Codes Utilization Among Medicare Fee-for-Service	
	(FFS) Beneficiaries in 2017". The report:	
	• noted only 1.4% of Medicare fee-for-service claims in 2017 were accompanied by a Z code; and	
	• highlighted several challenges and solutions that could increase the use of Z codes (e.g., need to address	
	lack of awareness of Z codes and confusion as to who can document Z codes; and need for more widely	
	adopted and consistent documentation related to Z codes).	
	We also reviewed the CMS infographic, "Using Z Codes: The Social Determinants of Health (SDOH) Data	
	Journey to better Outcomes". The infographic notes that:	
	• SDOH data may be documented in the problem or diagnosis list, patient or client history, or provider	
	notes;	
	 ICD-10-CM Z encounter codes (Z55-Z65) are available to document SDOH data; 	
	• Encourages use the ICD-10-CM Browser tool to search for ICD-10-CM codes and information on code	
	usage; and	
	• Indicates that health care administrators can understand how SDOH data can be gathered and tracked	
	using Z codes (including investing in EHRs to facilitate data collection and coding and deciding which Z code	
	data to use and monitor).	
	Comment: We appreciate the work undertaken by the Gravity Project and information provided by CMS	
	regarding the use of SDOH Z codes. We believe more work is needed to support the:	
	(i) collection and use of SDOH data;	
	(ii) enhance the quality, utility, and clarity of collected SDOH information; and	
	(iii) use of automated collection techniques or other forms of information technology to capture SDOH	
	data. We de not believe the level of avidence are ideal in the CMC 7 Code information is sufficient for abusical	
	We do not believe the level of guidance provided in the CMS Z Code infographic is sufficient for physical	
	health, behavioral health, and social service providers; payers; social service programs; and information	
	system vendors to understand: • the complex and multiplicity of workflows that could be involved in the exchange and relies of SDOH	
	 the complex and multiplicity of workflows that could be involved in the exchange and re-use of SDOH 	
	data; and • when to use various code sets (i.e., ICD 10 CM_SNOMED_LOINC) for different purposes	
	when to use various code sets (i.e., ICD-10-CM, SNOMED, LOINC) for different purposes. We agree with the CMS report that more widely adopted and consistent documentation related to 7 codes	
	We agree with the CMS report that more widely adopted and consistent documentation related to Z codes is peeded	
	is needed.	

	5/40/2024		Toward that end, we recommend that the ONC in collaboration with CMS: • summarize the literature regarding the: o costs and benefits of providers and payers (including Medicaid) of collecting and using SDOH data; and o population health management activities that have been undertaken by providers and payers (including Medicaid) • develop a toolkit that could be used by providers, payers, and programs regarding the collection and use of SDOH data, including how SDOH codes could be included on claims and for what purposes; and • develop guidance on the workflows that could be used to support the collection, exchange, and use of SDOH data. Specifically, we recommend that these workflows be developed for: o providers (physical health, behavioral health, and social service providers); o payers (including Medicaid); o social service programs (e.g., TANF, SNAP, schools); and o the interoperable exchange and re-use of SDOH content between these organizations. Finally, we recommend that Federal Government, including ONC and CMS, support investments in the infrastructure needed to support Community Information Exchange (CIE). For example, the Federal Government could award grants to State Medicaid Agencies (SMA) for the design, development, and implementation of the infrastructure needed for CIE. Such grant program could: • Require that the SMA partner with other state agencies to identify shared needs for SDOH data and opportunities to re-use SDOH data across agencies; and • Require the SMA to design a CIE infrastructure that: o Supports the creation and re-use interoperable SDOH data at the point of care; o Enables the exchange and re-use of interoperable SDOH data between providers (physical health, behavioral health, and social service providers), payers, social service programs, and between state agencies to improve patient outcomes, decrease costs, and enable needed population health analytics; o Leverages, re-uses, and extends information system functionalities required by CMS and ONC (e.g.	
13	5/10/2021	Lauren Choi, MA, JD Blue Cross Blue Shield Association	The Blue Cross Blue Shield Association (BCBSA) appreciates the opportunity to respond to the Office of the National Coordinator's (ONC) request for comments on Access, Exchange, and use of Social Determinants of Health Data in Clinical Notes, as published in the Federal Register on March 11, 2021 (86 FR 13908). BCBSA is a national federation of 35 independent, community-based and locally operated Blue Cross and Blue Shield (BCBS) companies (Plans) that collectively provide health care coverage for one in three Americans. For more than 90 years, BCBS companies have offered quality health care coverage in all markets across America – serving those who purchase coverage on their own as well as those who obtain coverage through an employer, Medicare and Medicaid. BCBSA believes that everyone should have access to high-quality health care regardless of race, ethnicity, national origin, sex, gender identity, sexual orientation, religion, education level, age, geography or disability. BCBS Plans across the country are actively engaged in hundreds of initiatives to advance health equity, with every Plan operating at least one local initiative. Many of BCBS Plans' initiatives focus on addressing social determinants of health (SDOH) across crucial areas like food insecurity, housing and transportation. Other BCBS companies' initiatives address health disparities within a specific health	Thank you for submitting your comment for the Office of the National Coordinator for Health IT (ONC) <u>Federal Register Notice</u> published March 11, 2021. This message is to advise that your comment is currently being reviewed.

	condition, including diabetes, heart disease, behavioral health and maternal health – areas known to	
	adversely affect underserved communities in America.	
	Our efforts to advance health equity also involve ways to leverage advanced technologies and analytical	
	models that focus on multiple factors including SDOH data and outcomes rather than cost alone, as well as	
	balancing the potential for unintended skewed results from the use of these novel technologies.	
	Additionally, thoughtful and secure application of novel technologies could help advance population health	
	at the community level by raising awareness and providing utilization metrics that surface actionable	
	insights for industry initiatives and community programs.	
	To better identify and address health disparities, and to improve the current and future application of novel	
	technologies, we believe it will be important for the Department of Health and Human Services (HHS) to	
	support the standardization of SDOH data with electronic health records (EHRs). We encourage HHS to	
	continue to engage with public-private initiatives to develop, identify and incorporate SDOH data elements	
	and classes as well as implementation guides to support seamless access, exchange and use of SDOH data.	
	With these goals in mind, we provide the following priority recommendations in response to the proposed	
	collection for public comment.	
	2 Continue the methodical and stakeholder-driven process for considering data elements and classes to	
	include in the U.S. Core Data for Interoperability (USCDI) standard. We appreciate the process that the HHS	
	Office of the National Coordinator for Health IT has undertaken and believe that public stakeholder input is	
	critical for the continued evolution of the USCDI standard.	
	2 Standardized social determinants of health data is critical to empowering providers and payers to better	
	identify and address patients' holistic health and social needs. Stakeholder-driven efforts like the HL7	
	Gravity Project are leading the way in developing standards and implementation guides to enable the	
	access, exchange and use of social determinants data.	
	2 Social determinants of health data should be included in future versions of the USCDI. We support the	
	inclusion of social determinants data classes and elements in future versions of the USCDI. We specifically	
	support the two approaches recommended by the Gravity Project in its December 2020 letter to ONC	
	urging the inclusion of a social determinants data class to the USCDI Version 2.	
	In what follows, we expand on the above recommendations and offer additional details regarding the	
	access, exchange and use of SDOH data in clinical notes.	
	Issue: Expanding the USCDI	
	The 21st Century Cures Act (Cures Act) requires HHS and ONC to improve the interoperability of health	
	information. ONC's Cures Act Final Rule also identifies important data elements that should be made	
	electronically available and exchanged through the use of health information technology (IT). The United	
	States Core Data for Interoperability (USCDI) is a standardized set of health data classes and constituent	
	data elements for nationwide, interoperable health information exchange.	
	ONC has developed a process for expanding the current USCDI Version 1, including a submission system	
	through which stakeholders may submit data elements and classes to be considered for future versions of	
	USCDI. As a result of this public input process, ONC released the draft USCDI Version 2 in January of this	
	year, which proposes to modestly expand the data elements included in the USCDI. ONC has also begun the	
	process of soliciting feedback and reviewing stakeholder submissions for USCDI Version 3, which will be	
	released in January 2022.	
	Recommendation:	
	BCBSA supports the use of USCDI as the clinical data standard in required Application Programming	
	Interfaces (APIs) and for health data exchange across entities; the use of a standardized set of data classes	
	of codes is critical to enable the seamless exchange of health information.	
	Rationale:	
		1

BCBSA applauds ONC's methodical and stakeholder-driven process for considering data elements and	
classes to include in the USCDI. The USCDI is a good representation of the data providers need to direct	
care, and which consumers need to facilitate their care, and should continue to be reflective of such needs	
moving forward.	
Issue: Standardizing SDOH Data	
As ONC notes in the proposed collection for public comment, the access, exchange and use of social	
determinants of health data is much more limited than other health data.	
Recommendation:	
BCBSA believes that documenting and sharing SDOH-related assessment, diagnosis and treatment	
information using progressive coding and data exchanges standards has the potential to improve whole-	
person care, well-being, and health outcomes. Therefore, we strongly support the standardization and	
inclusion of social determinants data elements, enabling seamless access, exchange and use of such data	
for patient care.	
Rationale:	
BCBSA agrees with ONC that accessing social determinants of health data during the course of care will	
allow providers and payers to better identify and address patients' social needs and improve health	
outcomes. Unfortunately, previous efforts to align and standardize health data across EHRs and other	
systems of record has largely been limited to clinical data.	
With rapidly increasing interest in collecting social risk data, the HL7 Gravity Project is a direct response to	
calls-to-action around the development of national standards for SDOH data reported in EHRs. The Gravity	
Project convenes broad stakeholder groups and over 1200 nationwide collaborators in "identifying and	
harmonizing social risk factor data for interoperable electronic health information exchange." BCBSA and	
BCBS Plans are proud to be founding and active members in the Gravity Project's collaborative efforts to	
reduce the current barriers to integration of social risk data into clinical decision-making.	
The Gravity Project has developed use cases to support the documentation of specific social domains;	
identified common data elements and their associated value sets; identified gaps in current data elements	
and value sets and developed recommendations to fill them; developed recommendations on how to best	
capture and group data elements for interoperable electronic exchange and aggregation; and created a	
Fast Healthcare Interoperability Resources (FHIR) Implementation Guide based on the defined use cases	
and associated data sets.	
The Gravity Project's collaborative efforts have set a foundation for standardizing critical SDOH data,	
enabling its integration into EHRs and for interoperable electronic health information exchange.	
Issue: Including SDOH Data in the USCDI	
HHS and ONC proposes to identify social determinants of health data elements for potential inclusion in the	
USCDI in the future.	
Recommendation:	
BCBSA supports the inclusion of social determinants of health data elements in the USCDI and recommends	
that ONC use the approaches recommended by the Gravity Project, as described in its December 2020	
letter to ONC.	
Rationale:	
BCBSA believes a standards-based integration of SDOH data into the USCDI is a time-sensitive action for interoperable data exchange to improve the health and well-being of those we serve.	
The inclusion of SDOH as a new data class in USCDI is a requisite for better identifying social needs and	
capturing social risk. Incorporating and enabling the interoperable exchange of such data will support a	
focus on, and prioritization of, use cases with a high impact on the triple aim—HHS' widely accepted policy
