General Comment

Those with acquired disabilities may easily take more than 100% of your time estimate just locating the dates for when symptoms, diagnoses, services, etc. developed to go with some of your questions since our health care system is so fragmented; thus any accurate estimate for time to complete would be exponentially more than you erroneously estimate for those without hand use limitations and without cognitive limitations, which would be a sizable percent of your population (approx. 11%) and thus require yet further additional time to your estimate.
