## Surveys

### Off-Farm Grain Stocks

The Off-Farm Grain Stocks surveys provide detailed estimates of grains, oilseeds, and pulse crops stored in any commercial facility off the farm.

These surveys are conducted in every state for barley, canola, corn, flaxseed, mustard seed, oats, rapeseed, safflower, sorghum, soybeans, sunflowers, and wheat. Grain stocks frequently move to areas other than where produced, thus requiring coverage by all states to fully account for all off-farm stocks. Minnesota, North Dakota, and South Dakota are the only states estimating rye stocks. Austrian winter peas, chickpeas (garbanzos), dry edible peas, and lentils are estimated in California, Idaho, Minnesota, Montana, Nebraska, North Dakota, Oregon, South Dakota, and Washington. The target population is all commercial grain storage operations, including grain and oilseed processing plants, terminals, and any other facilities that store grains, oilseeds, and pulse crops (excluding peanuts and rice) that would not be classified as a farm. Separate rice stocks surveys are conducted in Arkansas, California, Louisiana, Mississippi, Missouri, and Texas. Peanut stocks are estimated for the U.S. only.
