The DHS Chemical Security Assessment Tool (CSAT) Portal is an outstanding resource for private sector partners to collect and submit and CFATS program required data to CISA. The tool also facilitates correspondence between CISA and private sector companies, and serves as a valuable data repository, which provides significant program historical documentation. The portals automated processes streamline data collection, organization and submissions, therefore ultimately reducing what could be a major administrative burden otherwise. Data is also retained, so revisions are generally quick and painless. Overall, this resource provides significant value added to the program.
