Ms. Mussington,

David Schanoes makes excellent points in the posting above. Please include it in the public docket. Please especially note the omission of stalled trains. This can occur because of inadequate assigned power, failed locomotives enroute, stuck air brakes and presumably other factors. A stalled train in the wrong place is an impediment to local mobility and public safety. In many cases, hand brakes must be applied and released in areas with no established walkways. It also represents economic waste that should be considered in future rulemakings.
