Vickie,

Thank you for supporting the *Residential Utility Disconnections Survey*.

Assuming the Office of Management and Budget (OMB) approves the survey, we will start collecting disconnection data for 2024 in early 2025.

We plan to publish data at the utility level and aggregate it to the state, census division, and national levels.

Subject: [EXTERNAL] Access to electricity

•

Greetings.

In the increasingly chaotic weather times that we live in because of climate change, we must take a look at the systems necessary to protect human life and prevent suffering. One of those systems is shut-offs of electricity.

Shut-offs in extreme weather conditions can harm the health of older people, children and other vulnerable populations. Shut-offs can lead to extreme suffering and even deaths. The EIA should develop a database of utility shut-offs to monitor those situations.

Collecting good data and making it transparent and easily

accessible will encourage good decision making about an important issue that is set to become even worse. The data from utility companies should be shared nationwide for consistent standards and access.

Thank you for your consideration of and action on this important issue.

Sincerely,

Vickie Atkinson

Subject: [EXTERNAL] Support collection of shut-off data

To whom it may concern:

I support the development of a database of utility shut-off information for these reasons:

In our current status of climate change, those most at risk are/will be those least financially secure. Shut-off data can be used by both governmental and non-governmental organizations in providing services to these needy families.

For example, when the ADA was being rolled out, several urban utilities were approached for their shut-off data. Recognizing that if/when families had access to affordable healthcare, it would be more likely they would have the funds to pay for their utilities; several companies willingly shared their data.

Thank you for your attention to this matter,
Sincerely,

H. Jean Bryan, ED.D.
Chicago, Illinois

Subject: [EXTERNAL] Comments in support of EIA-112 (Residential Utility Disconnections Survey)

Hello EIA,

I am the founder of the Green Neighbor Challenge. We have built and maintain a digital toolkit to help ordinary residents across the US navigate their home energy transition. I am writing to support the implementation of EIA-112 survey questions, regarding residential utility disconnections.

People have a right to energy access, and electric-utilities are public serving entities, most of which are allowed to operate as monopolies. The power of utilities to disconnect citizens from energy represents a very grave power that should be used responsibly. All too often utilities do not do their due diligence in helping their own customers access programs that could assist them such as LIHEAP and Weatherization Assistance. Utility disconnection creates a crisis in the lives of the families affected, and only a minor inconvenience to the entities performing the disconnection. For purposes of equity, justice, and transparency, it is critical that advocates and consumer protection organizations have access to utility shutoff data in some granular geographic way to address the disproportionate impact utility shutoffs have in particular communities.

Green Neighbor Challenge itself is host to scorecards of rural electric cooperatives, and works in coalition with other consumer advocate organizations to improve the relations between rural electric cooperatives and their own members. It is better for everyone, when public utilities and their consumers work together to find solutions, than when they work against one another,

deepening a culture of distrust around the energy system.

Please create a central source of residential utility disconnection data, with geographic granularity. Good information is essential to the healthy function of democracy and civil society.

Thank you for this opportunity to give public input,

Andrew Butts

Subject: [EXTERNAL] Residential energy utility shut offs

Dear EIA agency:

Please consider the following comments and input for the data gathering form for inclusion in your database tracking tool.

The basic need for electricity is a human right, aligned with Nikola Tesla's work many decades earlier. The COVID-19 pandemic drove this point home as well with many families scrambling to afford basic services like water and electricity.

No one should have to decide between putting food on the table and keeping the lights on. The issue is still persistent among people of color and many frontline, low-income communities who are bearing the brunt of the climate crisis. This demographic also bears the brunt of a higher than average energy burden proportionate to income.

The energy affordability issue is symptomatic of large utilities taking advantage of customers in a predatory sense. This can negatively impact ratepayers credit history and reporting as they are often turned over to collection agencies.

Thank you for your time and consideration of these concerns and for allowing me to comment on this potential life saving issue.

Subject: [EXTERNAL] We need to know the lights are on!

Dear Energy Information Administration,

I am writing to make my public comments known on the issue of data transparency and collection through form EIA-12. As an elder activist of Third Act! I am deeply concerned about the energy inequalities and problems in our country.

The development of an expanded data base of utility shut-offs will increase the data transparency that can help enshrine access to utilities as a basic human right. Data transparency will help us make good energy decisions.

The data from form EIA-112 can achieve far more than the EIA's stated goal of aiding decisions regarding budgetary support for the Low-Income Heating Energy Assistance Program (LIHEAP). **By delivering much-needed data transparency on the scale and nature of our country's utility shutoff crisis, the survey can also bolster the efforts of utility justice advocates and public officials who fight for more transformative and longer-lasting solutions to energy poverty**—like utility shutoff bans, income-based debt relief and management programs, increased funding for the Weatherization Assistance Program (WAP), equitable rate restructuring, and the equitable deployment of distributed energy resources (DERs).

Although shutoff data exists, **persistent data gaps at the national level continue to mask the true magnitude of utility injustices.**

The findings only capture a portion of nationwide utility shutoff totals because **44% (22) of states fail to require utilities to disclose their residential electric and gas shutoffs for non-**

payment. Even among the 29 states that do require disclosures, as of 2023, only 13 mandated clear, standardized, and monthly data.

Given the enormous scale of national energy unaffordability, the survey should include more data on customer debt to clarify the harmful impact of predatory credit and collection policies at the state and utility levels.

In a climate-changed world, access to life-saving electricity is a human right! Share this data from utility companies nationwide for consistent standards and access.

Access to utilities like electricity is a human right. Yet these life-saving services remain unaffordable and inaccessible for countless families across the country. This was especially pertinent during the COVID-19 pandemic, when an economic downturn combined with a lockdown meant families had to make sacrifices over putting food on the table or paying a utility bill. **Even after the pandemic, this crisis persists as profit-driven utilities prioritize their bottom line over ensuring access to a public good.**

No one should have to forego basic needs to keep the lights on.

Please act now to expand and improve the EIA data collection and data base!
Thank you for your service to the people of our country,
Bonnie Friedmann (California Voter)

Hi

I urge you to develop a utility shutoff database for the country.

Many utilities around the country are not required to report data about who they're shutting down and how their policies are affecting customers. And it's often the same bad-faith utilities who are harming low- and fixed-income older Americans in this manner - and harming *everyone* with their fossil-fuel-friendly plans! We need this!

Thanks.

Subject: [EXTERNAL] Utility Shut-Off Survey

Hi there!

My name is Jordan, I am 25 and I live in the Shelby Park area. I've been in Louisville for 20 years. Lately I've been experiencing a constant amount of disconnections from my utilities on and off. It is incredibly frustrating. When I learned that there wasn't a database or any form of documentation of when this occurred it made me concerned. I think that implementing a database will inform communities of when utility disconnection is happening to others nearby. This will assist with future problem solving efforts to cease utility disconnection.

Thank you for reading my comment. I would like to see legislative change when it comes to this matter.

Subject: [EXTERNAL] Utility disconnection data

To whom it may concern:

I am requesting that your agency routinely collect and share utility disconnection data. I live in NC where reporting is irregular or delayed. Energy poverty is a real thing and has only worsened since COVID-19 and continues to worsen during the increase in extreme weather events that we are experiencing.

Please develop a database of utility disconnections that happen because of the inability to pay energy bills. Please create a system of transparency so that we may hold utility companies responsible for a better decision process.

Energy is a basic human right and yet, private utility companies (like Duke Energy in NC) reap record breaking profits. Is it right for a CEO of a utility company to make double digit millions in annual salary and compensation and still disconnect power from vulnerable people like one of our elders that depend on an oxygen machine? Of course not! Whereas you do not have the power to mandate what the state Utilities Commissions are responsible for, you do have the power to collect and share utility data.

Thank you for your consideration.

Mardi,

Thank you for supporting the *Residential Utility Disconnections Survey*.

Assuming the Office of Management and Budget (OMB) approves the survey, we will start collecting disconnection data for 2024 in early 2025.

We plan to publish data at the utility level and aggregate it to the state, census division, and national levels.

Subject: [EXTERNAL] a national database for utility shut offs

I live in Illinois and in our state, we have access to information as to how many electric and gas customers are subject to having their utilities cut off because they are in arrears. This information is very important and we use it to educate the public on the need to keep a reign in on utility rate hikes.

Please start collecting this data in all US states, so that we can get a full picture of what is happening in our country. What with global climate change and the anticipated changes in how are energy is generated and delivered, we can use all the data we can get in order to make the change more manageable for our energy users.

It's only fair. We have for-profit, monopoly utilities and most customers have NO choice about their electricity provider.

In my experience, utilities could care less about what people want, they only care about money. They don't care about climate change, pollution, coal ash, acid rain, ozone, hazardous waste, nuclear waste, contaminated water and health and environmental damage. I wish it wasn't true, but after 20 years in the electricity industry working for more clean energy, this is what I have seen.

Over and over and over.

The number of people who can't pay their bills are skyrocketing. If we don't have data, we can't make good decisions. Utilities now can disconnect 10% of total customers every year.

The tail is wagging the dog in the electricity industry right now. The utilities act like they have a divine right to give us coal, fracked gas and pretend pollution and climate change don't exist. Right.

Do the right thing. AT least let's COUNT the people who have electricity cut off.

Subject: [EXTERNAL] Federal data on Utility Shut-Offs / Disconnects

EIA Employees,

I write to you today, as a retired **medical epidemiologist** who worked as a federal employee at the Centers for Disease Control and Prevention in Atlanta for 32 years.

One of the fundamental principles of disease surveillance is that it works best when it is conducted in a standardized manner in every state in the USA. For chronic diseases, this allowed us to compare states and to draw inferences from those which are doing relatively well, that helped improve chronic disease prevention and treatment in those which were doing relatively poorly. In infectious diseases, comprehensive surveillance is critical for early detection, warnings, and responses, and to better inform prevention and control measures.

I live in Georgia, one of about 15 states that was judged to have "Up-to-Date Reporting" of electric utility "shut-offs" (disconnections) in household residences. Reporting in another dozen states was judged to be "Irregular or Delayed". Electric and gas providers in the remaining 23 states apparently have no data to share with your agency. As you know well, different states have different policies regarding "shut-offs" - some states prohibit in summer and winter months, where it can result

in severe illness or death from hypothermia or hyperthermia. Others have only one, or neither of those policies. As our climate changes, understanding the effect of utility shut-offs on morbidity and mortality in all parts of the US and during all months of the year would help shape effective public health measures to ensure that unnecessary hospital admissions are prevented, and that lives are not lost prematurely.

I strongly support the Residential Utility Disconnections Survey (EIA-112) of electric and natural gas regarding final termination notices, service disconnections, and reconnections for bill non-payment across residential customers. All citizens deserve to be treated fairly by the electric utilities, in particular those who live in service areas where there is no option to choose a different provider.

I sincerely hope that you will be able to implement this survey as quickly as possible, and that it will provide strong enough evidence to repeat it annually so that utilities no longer have a free hand to do harm to their customers without reporting it to the state and federal authorities charged with making sure that the utilities operate safely, reliably, and in the best interests of the customers they serve and the state and country in which they operate.

Thank you for your consideration of this email. Please carry on the good work that you are doing!

Best regards,

e.

Subject: [EXTERNAL] Support for Residential Utility Shutoff Survey

Dear Colleagues,

I am writing to give my strongest support for the Residential Utility Shutoff Survey.

It is amazing that in 2024 the EIA has not already implemented such a survey as standard practice to track final disconnection notices due to bill non-payment, service disconnections due to non-payment, and reconnections of residential customers who were disconnected due to non-payment.

This is a no-brainer for public policy and it relates the energy sector to other social services and outcomes.

Thank you for considering my comment.

Hello EIA,

I am the founder of the Green Neighbor Challenge. We have built and maintain a digital toolkit to help ordinary residents across the US navigate their home energy transition. I am writing to support the implementation of EIA-112 survey questions, regarding residential utility disconnections.

People have a right to energy access, and electric-utilities are public serving entities, most of which are allowed to operate as monopolies. The power of utilities to disconnect citizens from energy represents a very grave power that should be used responsibly. All too often utilities do not do their due diligence in helping their own customers access programs that could assist them such as LIHEAP and Weatherization Assistance. Utility disconnection creates a crisis in the lives of the families affected, and only a minor inconvenience to the entities performing the disconnection. For purposes of equity, justice, and transparency, it is critical that advocates and consumer protection organizations have access to utility shutoff data in some granular geographic way to address the disproportionate impact utility shutoffs have in particular communities.

Green Neighbor Challenge itself is host to scorecards of rural electric cooperatives, and works in coalition with other consumer advocate organizations to improve the relations between rural electric cooperatives and their own members. It is better for everyone, when public utilities and their consumers work together to find solutions, than when they work against one another,

deepening a culture of distrust around the energy system.

Please create a central source of residential utility disconnection data, with geographic granularity. Good information is essential to the healthy function of democracy and civil society.

Thank you for this opportunity to give public input,

Andrew Butts

Subject: [EXTERNAL] Develop a transparent database of utility shut-offs!

Dear Energy Information Administration staff,

As a concerned U.S. citizen and Chicago resident, I write as a wife, mother, and retired clinical social worker with over four decades in healthcare. I fear for our children and all life forms due to humanity's toxic impact on the planet. We face an environmental crisis that demands urgent action to preserve life and ecosystems. A crucial part of this work is ensuring access to life-saving electricity, especially in a climate-changed world.

During the COVID pandemic, utility shut-offs worsened for underprivileged customers as job losses made it difficult to pay bills. Now, climate-change-fueled weather extremes are deepening the impact. Many utilities are not required to report shut-off data, leaving vulnerable populations at greater risk. These same bad-faith utilities often harm low- and fixed-income older Americans while pushing fossil-fuel-friendly agendas.

I urge the U.S. Department of Energy's Energy Information Administration (EIA) to develop a transparent database of utility shut-offs, ensuring nationwide standards and access to data. This transparency is essential for making informed, fair decisions that protect the most vulnerable.

Sincerely,

Carolyn Petrakis

Subject: [EXTERNAL] Collect and share utility shutoff data

To whom it may concern:

And I do hope it concerns you.

As climate change worsens, we need to make sure our most vulnerable citizens are protected from profit driven utility companies' greedy practices. One way to do this is for the EIA to collect and share utility shutoff data.

As we've seen across the country, utility companies are undermining our ability to reduce fossil fuel dependency and move to clean renewable energy because they won't make a killing off it. And they don't give a damn who suffers as long as they make their money.

But by developing a utility cutoff database and sharing it nationwide, standards can guarantee a humane approach to utility access.

We have to change the reasons we do things if we are to survive.

Sincerely,

Rosemary Robinson

Dear EIA director and staff,

I am writing as a university professor who studies energy poverty and also as a supporter of Third Act, an organization of senior citizens working for environmentally sustainable policies. I am disturbed to learn that our government has not kept track of data from private utilities on customer shut offs due to ability to pay – especially since many services like electricity, and gas for heating and cooling are crucial to life and health in extreme weather. Please make an urgent effort to gather comprehensive data on utility shut-offs and make them available to the public and media as soon as possible.
