1902-0252 Federal Energy Regulatory

The Bulk Power System is in need of compliance testing to ensure all systems are in proper operation mode and the proper functioning mechanisms are consistent for all agencies. This is a critical step for access and consistency across all departments. Reliability is needed to prevent fraudulent activity that appears to be normal in the content. How do we differentiate between the two types, when they both are in the system? Reminds me of phishing testing and being able to determine legitimate content, it's not easy. There is work to do to ensure secure computing with one simple method that anyone could use to know your hardware is protected and functioning properly.
