

How might we define the **best implementations for recommended changes to national notifiable disease reporting** in ways that meet STLTs where they are?

How might we define the best implementations to **reduce burden of STLT data sharing with CDC** using the "one front door" policy?

How might CDC **make it easier for STLTs to use eCR data** for surveillance and response?

How might CDC leadership and the PH informatics community **best support STLTs and CDC programs in the delivery of shared services across the product development life cycle: ideation, prioritization, design, building, QA, dissemination, adoption, usage, evaluation, and iteration?**

How might CDC **transform NBS into the reference implementation for a public health surveillance and response system fully compliant with best practices** in software design and implementation?

How might we come to **nationwide consensus on the fundamental tenets of the design of future systems to support public health data ingestion, exchange, and analysis**; and the roadmap for STLTs to move toward those commonly held system designs?
