I am writing to express my strong opposition to the U.S. Department of Education's May 2025 proposal to continue limiting performance data reporting in EDFacts.

To maintain high standards in public education, we must have access to detailed, transparent, and comparable student achievement data. A single "percent proficient" figure is insufficient for evaluating academic growth, identifying excellence, or guiding improvement efforts.

As an education entrepreneur working in collaboration with publicly-funded systems to explore the use of technology such as artificial intelligence, this would significantly reduce my company's ability to work effectively. This would undermine our work to enhance student learning, improve accessibility, and empower teachers while reducing burnout, and further incentivize us to offer our technology to private systems and schooling systems outside the US.

I support the original November 2024 proposal that would restore reporting of student counts in each performance category for reading and math. This level of detail is critical for researchers, educators, and policymakers committed to strengthening academic outcomes nationwide.

Please reinstate the requirement for full performance-level reporting beginning in the 2025–26 school year.

Thank you.
