## General Comment

Is a survey of 4,000 adults statistically significant? What percent of the population does not have a cell phone or landline? To perform this survey suggests the use of/collection of PII data - age, phone number, ethnicity, etc. A larger data set for the assessment of listeriosis in those over 60 years of age taking immunocompromising medications should be found in the datasets evaluated for ADR. The CDC has already noted that *Toxoplasma gondii* is one of the "Neglected Parasitic Infections in the United States". Why don't you consult with and work with the CDC. If " 22.5% of the population 12 years and older have been infected" with *Toxoplasma gondii* why is this a 'new' issue?
