EXECUTIVE SUMMARY

In July 2018, three cigar industry trade groups (the Cigar Association of America, Inc., Cigar Rights of America, and the International Premium Cigar and Pipe Retailers Association (now the Premium Cigar Association)) commissioned an independent expert report examining usage patterns of premium cigars in U.S. youth and adults (“July 2018 Report”). The July 2018 Report, entitled “Report Regarding Consumption Patterns of Premium Cigars,”¹ analyzed results from the Population Assessment of Tobacco and Health (“PATH”) Study to examine use prevalence and usage patterns of premium cigars as well as demographic characteristics of users. The PATH Study, administered by FDA, NIH, and NIDA, and the only study of its kind, follows adult and youth participants over time with repeated survey data collections. This allows for ongoing evaluation of nationally representative estimates of tobacco utilization, beliefs, and health outcomes in the United States. At the time of the July 2018 Report, three PATH Study waves were available for analysis: Wave 1 (collected September 2013 – December 2014); Wave 2 (collected October 2014 – October 2015), and Wave 3 (collected October 2015 – October 2016).

Since the completion of the July 2018 Report, additional PATH data have been released publicly. In June 2022, an update was issued examining Wave 4 (collected December 2016 – January 2018) and Wave 5 (collected December 2018 – November 2019) full youth and adult data collections, as well as Wave 4.5 (collected December 2017 – December 1, 2018) youth-only data collection (“June 2022 Report”).² In November 2023, an abbreviated update was issued on analyses of Wave 5.5 (collected December 2019 – December 2020) with youth-only data collections and Wave 6 (collected March 2021-November 2021).

This report – the third update to the July 2018 Report (“January 2024 Report”) continues the PATH data analyses. It further supplements prior results with the most recently released PATH data to update estimates of premium cigar use prevalence and usage patterns.³ Specifically, it provides an analysis of Wave 5.5 (collected December 2019 – December 2020) with youth-only data collections and Wave 6 (collected March 2021-November 2021) with full youth and adult data collections. An additional adult data collection is also included, combining young adult (age 18-19) Wave 5.5 data with additional adult (ages 20 and older) data collected as part of the PATH-Adult Telephone Survey (PATH-ATS, collected September 2020-December 2020).

Consistent with the conclusions of the July 2018 Report and the July 2022 Report, the January 2024 Report continues to demonstrate that premium cigars, including flavored premium cigars, are used in different ways and by different populations than other tobacco products. *Specifically, while youth usage of premium cigars was extremely rare in early waves, it is completely undetected in the most recent PATH data collections.* It also demonstrates that adult premium cigar consumers are older males, with

¹ Cigar Association of America, Inc. Comment to Docket No. FDA-2017-N-6107. Regulation of Premium Cigars.

² Consilium Sciences. Report Regarding Consumption Patterns of Premium Cigars – Updated Analysis of PATH, Wave 1 through Wave 5. 23 June 2022. The July 2022 Report was commissioned by the Cigar Association of America, Inc., Davidoff of Geneva, Inc., SWI-DE, LLC d/b/a Drew Estate, General Cigar Company and Tabacalera USA.

³ Updates to certain data tables in the June 2022 Report were provided to the Office of Management and Budget as part of the meeting Drew Estate had with that office on November 7, 2023. The January 2024 Report represents the full update.

higher educational levels and socioeconomic status, who use them only 1-2 days per month, and then just 1-2 cigars per day.

The January 2024 Report, similar to the July 2018 Report and the July 2022 Report, presents data on “overall premium cigars” and “unflavored premium cigars.” It does not directly present data on “flavored premium cigars.” This is solely because the prevalence of use and the number of data records available for this category is so low that reliable statistical calculations cannot be performed on a “flavored premium cigar” dataset. Moreover, as demonstrated throughout this Report, the analysis on premium cigars shows no statistically significant differences whether looking at “overall premium cigars” or “unflavored premium cigars” (or, by extension, “flavored premium cigars”), demonstrating there are no differences in how any premium cigar products are used by adult consumers. Because of the low prevalence (or in some case absence of) reported usage of flavored premium cigars, the charts in this Report do not present any “flavored” premium cigar data in a stand-alone category.

The January 2024 Report is consistent with the July 2018 Report and July 2022 Report:

- **Youth Usage:** Youth usage of premium cigars is lower than any other tobacco product. *Only 0.09%, 0.05%, and 0.02% of youth reported use of premium cigars in Waves 1, 2 and 3 respectively, and in fact not a single youth participant reported smoking any premium cigars in Waves 4, 4.5, 5, 5.5, or 6.*
 - No youth participants reported smoking flavored premium cigars in any Wave of the PATH Study.
- **Adult Prevalence:** Premium cigar usage among adults remained below 1% through all Waves of the PATH Study for overall premium cigar use, unflavored premium cigar use, and by extension flavored premium cigar use.⁴
- **Demographics:** Demographics of adult premium cigar smokers were unchanged through all Waves of the PATH Study -- this population is comprised typically of white males, mostly 35 years or older, with higher educational levels and socio-economic status.
 - There are no statistically significant demographic differences between the adult users of all premium cigars and unflavored premium cigars, and by extension flavored premium cigars.
 - The demographic data for all Waves is only on adults, *as there were either too few or no reported youth usage of premium cigars to prepare the same analysis.*
- **Frequency and Intensity:**
 - Across all Waves of the PATH Study approximately 95% of adult premium cigar users smoke occasionally (less than every day).

⁴ Throughout the report the term “by extension to flavored premium cigars” is used where there is low or no reported usage of flavored premium cigars. The results for overall premium cigars and unflavored premium cigars are, however, consistent, meaning the conclusions for those categories logically extend to flavored premium cigars.

- Across all Waves of the PATH Study the median number of premium cigars smoked per month was 1.0-2.0 premium cigars.
- Both of these findings apply to overall premium cigars and unflavored premium cigars, and by extension flavored premium cigars.
- Initiation and Progression to Other Tobacco Products:
 - There is no statistically significant difference regarding age of initiation across all Waves of the PATH Study for overall premium cigars, unflavored premium cigars, and by extension flavored premium cigars.
 - There is no statistically significant difference for overall premium cigars, unflavored premium cigars, and by extension flavored premium cigars regarding progression to use of other tobacco products across all Waves of the PATH Study.
 - Progression to everyday smoking among premium cigar users who did not previously smoke cigarettes daily is less than 2% of users.
 - In all Waves of the PATH Study, except for one reported record those premium cigar smokers who progressed to smoking cigarettes smoked only unflavored premium cigars.
 - Most current premium cigar users did not also currently smoke cigarettes, and cigarette smoking frequency and intensity was low among this user group (less than five cigarette smoking days per month, and less than five cigarettes smoked on such days).
 - Current premium cigar dual users did not smoke more premium cigars than those who were not dual users and did not smoke premium cigars with more frequency or intensity than those who were not dual users.

Taken together, the findings presented in this Report are all consistent with those presented in the July 2018 Report and the July 2022 Report, namely: (i) that youth use of premium cigars, unflavored or flavored, is extremely rare (undetected in the most recent PATH data collections); (ii) adult prevalence is below one percent for premium cigars overall, unflavored premium cigars, and by extension flavored premium cigars; and (iii) the demographics of adult premium cigar smokers remained consistent through all Waves of PATH data and for overall premium cigars, unflavored premium cigars, and by extension flavored premium cigars.

Notably, these results are consistent with those from an independently conducted analysis of PATH Wave 1-5 data, presented in a report issued in 2022 by the National Academies of Sciences, Engineering, and Medicine (NASEM)⁵. The NASEM Report, requested and funded by FDA, examined usage patterns and health effects of premium cigars. In sum, the findings based on the more recent Wave 5.5/PATH-ATS and Wave 6 data on premium cigar use in the U.S. simply extend the findings identified in the July

⁵ See Appendix D from the 2022 NASEM report: National Academies of Sciences, Engineering, and Medicine 2022. *Premium Cigars: Patterns of Use, Marketing, and Health Effects*. Washington, DC: The National Academies Press. <https://doi.org/10.17226/26421>.

2018 Report based on Wave 1 through Wave 3 data and the July 2022 Report that also incorporated Wave 4, Wave 4.5, and Wave 5 data. Trends were consistent across the first three waves (2013/14 through 2015/16) and recent results remained consistent or even improved (e.g., undetected youth use in most recent waves) for premium cigars from Wave 4 through Wave 6 (2017/18 through 2021).

1 BACKGROUND

In July 2018, three cigar industry trade associations (the Cigar Association of America, Inc., Cigar Rights of America, and the International Premium Cigar and Pipe Retailers Association (now the Premium Cigar Association) commissioned an independent expert report examining usage patterns of premium cigars in U.S. youth and adults (“July 2018 Report”). The July 2018 Report, entitled “Report Regarding Consumption Patterns of Premium Cigars”⁶ detailed results from analyses of the Population Assessment of Tobacco and Health (“PATH”) Study to examine use prevalence and usage patterns of premium cigars as well as demographic characteristics of users. The PATH study, administered by FDA and the only study of its kind, follows adult and youth participants over time with periodic survey data collections. This allows for ongoing evaluation, of nationally representative samples, of tobacco utilization, beliefs, and health outcomes in the United States. At the time of the July 2018 report, three PATH study waves were available for analysis: Wave 1 (collected September 2013 – December 2014); Wave 2 (collected October 2014 – October 2015), and Wave 3 (collected October 2015 – October 2016).

Since the completion of the July 2018 Report, additional PATH data has been released publicly. In June 2022, an updated report was issued that examined Wave 4 (collected December 2016 – January 2018) and Wave 5 (collected December 2018 – November 2019) full youth and adult data collections, as well as the Wave 4.5 (collected December 2017 – December 1, 2018) youth-only data collection (“June 2022 Report”).⁷

This report – a second update to the July 2018 Report (“January 2024 Report”) -- continues the PATH data analyses and supplements the results with the most recently released PATH data to update estimates of premium cigar use prevalence and usage patterns.⁸ Specifically, analyses of Wave 5.5 youth (collected December 2019 – December 2020) and the Wave 6 youth and adult (collected March 2021-November 2021) data are included in this report. An additional adult data collection is also included by combining young adult (age 18-19) Wave 5.5 data with additional adult (ages 20 and older) data collected as part of the PATH - Adult Telephone Survey (PATH-ATS, collected September 2020-December 2020).

Similar to the July 2022 Report, this January 2024 Report update details results of analyses of a replication of the original Wave 1 through Wave 3 analyses and is extended to include all currently available PATH data through Wave 6. In addition to use prevalence of premium and other cigar types among youth and adults in the U.S., demographics, age of initiation, as well as estimates of use frequency and intensity are reported. Finally, progression to cigarette smoking and usage patterns of dual users of cigarettes and cigars are examined.

⁶ Cigar Association of America, Inc. Comment to Docket No. FDA-2017-N-6107. Regulation of Premium Cigars.

⁷ Consilium Sciences. Report Regarding Consumption Patterns of Premium Cigars – Updated Analysis of PATH, Wave 1 through Wave 5. 23 June 2022. The July 2022 Report was commissioned by the Cigar Association of America, Inc., Davidoff of Geneva, Inc., Drew Estate, General Cigar Company and Tabacalera USA.

⁸ Updates to certain data tables in the June 2022 Report were provided to the Office of Management and Budget as part of the meeting Drew Estate had with that office on November 7, 2023. The January 2024 Report represents the full update.

DATA ANALYTICS

1.1 Data Source

PATH is a longitudinal study of tobacco use by and resulting health effects on youth and adults in the U.S.⁹ The PATH Study is conducted and managed collaboratively by the National Institute on Drug Abuse (NIDA), National Institutes of Health (NIH), and FDA’s Center for Tobacco Products (CTP). Two waves of follow-up interviews are scheduled with youth participants who complete their first interview, for a total of three waves of participation at minimum. In addition, the PATH Study used a four-stage stratified, address-based, area-probability sampling design at the outset of the study (Wave 1) that oversampled adult tobacco users, African Americans, and young adults (18–24 years). There have been six waves of data collection on youth and adults that are currently available for analysis, along with two additional data collections (Waves 4.5 and 5.5) conducted primarily with youth participants.¹⁰ An additional data collection (Adult Telephone Survey, ATS) was conducted with only adult participants (Table 1). The Wave 5.5 young adult (ages 18-19) data set were combined with the ATS data (ages 20 and older) to provide an additional set of adult estimates, according to instructions provided in the PATH Study public use files user guide¹¹.

Table 1. PATH Survey Data Collections, Timing and Number of Participants

Wave (Collection Dates)	Adult Participants (n)	Youth Participants (n)
Wave 1 (Sep 2013 – Dec 2014)	32,320	13,651
Wave 2 (Oct 2014 – Oct 2015)	28,362	12,172
Wave 3 (Oct 2015 – Oct 2016)	28,148	11,814
Wave 4 (Dec 2016 – Jan 2018)	33,644	14,793
Wave 4.5 (Dec 2017 – Dec 2018)	Youth Only Collection	12,918
Wave 5 (Dec 2018 – Nov 2019)	32,687	11,976
Wave 5.5 (Dec 2019 – Dec 2020)*	3,628	7,129
Adult Telephone Survey (Sep 2020 – Dec 2020)	8,874†	Adult Only Collection
Wave 6 (Mar 2021 – Nov 2021)	30,516	5,652

* Wave 5.5 was a special data collection focused on youth and young adults ranging in age from 13 to 19.

† The Adult Telephone Survey (ATS) was a special data collection from a subsample of PATH Study adult participants ages 20 or older.

1.2 Measures

Cigar types. Cigars are a diverse category, varying in size and shape, with and without filters, ranging in price from more expensive premium hand-rolled cigars to more economical machine-made cigars. PATH

⁹ Hyland, A. et al. (2017). "Design and methods of the Population Assessment of Tobacco and Health (PATH) Study." *Tob Control* **26**(4): 371-378.

¹⁰ Wave 5.5 was originally planned as a youth only data collection. However, the COVID19 pandemic prompted study administrators to broaden the scope of the data collection to focus on youth and young adults ranging in age from 13 to 19. It should also be noted that federal law changed the legal age of purchase of tobacco products from 18 to 21 in December 2019.

¹¹ See in particular Page 86 of the *ICPSR Special Collection Public-Use Files User Guide*

(<https://www.icpsr.umich.edu/files/NAHDAP/documentation/ug37786-all.pdf>, Last accessed December 29, 2023).

Study participants report separately whether they used little/filtered cigars, cigarillos, and/or traditional large cigars, with the PATH questionnaire displaying a photo of example products (see Figure 1), describing their physical characteristics, and listing popular brands. The questionnaire first asks participants to consider traditional cigars as follows:

“Traditional cigars contain tightly rolled tobacco that is wrapped in a tobacco leaf. Some common brands of cigars include Macanudo, Romeo y Julieta, and Arturo Fuente, but there are many others.”

Traditional Cigars

Images of cigarillos and filtered cigars are then displayed with the following text description:

“Cigarillos and filtered cigars are smaller than traditional cigars. They are usually brown. Some are the same size as cigarettes, and some come with tips or filters. Some common brands are Black & Mild, Swisher Sweets, Dutch Masters, Phillies Blunts, Prime Time, and Winchester.”

Cigarillos

Filtered Cigars

A follow-up question is then asked to distinguish users of filtered cigars (i.e., those who reported smoking cigars with a filter like a cigarette filter) from users of cigarillos (i.e., those who reported smoking cigars with a plastic or wooden tip or without a tip or filter).

While the PATH Study does not ask users specifically about “premium” cigars, researchers attempted to stratify the traditional cigar category into premium and non-premium subtypes using price per unit and/or respondent-provided brand name information^{12,13}. The July 2018 Report distinguished premium from non-premium traditional cigars based exclusively on brand and product name information provided by PATH participants.¹⁴ Doing so, however, introduced potential recall error/inconsistency issues that may impact estimate accuracy and validity.

¹² Corey, C. G. et al. (2018). "US Adult Cigar Smoking Patterns, Purchasing Behaviors, and Reasons for Use According to Cigar Type: Findings From the Population Assessment of Tobacco and Health (PATH) Study, 2013-2014." *Nicotine & Tobacco Research* **20**(12): 1457-1466.

¹³ Persoskie, A. et al (2019). "Cigar package quantity and smoking behavior." *BMC Public Health* **19**(1): 868.

¹⁴ The brand assignments established by Corey et al. (2018) served as the starting point with adjustment to the brand and product name designations made in consultation with the Cigar Association of America, Cigar Rights of America, and the International Premium Cigar and Pipe Retailers Association. Importantly, usual retail price was

To address this, the July 2022 Report update used a hybrid approach in which traditional cigar users were subcategorized. Brand/product name assignments made in the original July 2018 report were the primary manner in which premium cigar users were identified. Appendix E tabulates the number of participant records reporting traditional cigar brand and product names per wave for youth (Appendix E, Table E- 1 and Table E- 2) and adult (Appendix E, Table E- 3 and Table E- 4) traditional cigar users. In addition, the corresponding brand and product designation (e.g., premium (with “flavored” specified as appropriate), nonpremium) is likewise indicated.

Figure 1. Images of cigar types, as presented to participants in the Population Assessment of Tobacco & Health (PATH) Study. Reproduced from Persoskie et al. (2019).

In addition, for the subset of adult traditional cigar users who could not be subcategorized by reported brand (due to missing information or under-specification in the PUFs), traditional cigar users reporting spending \$2.00 or more per cigar (the calculation of which is detailed below under “Package Quantity”) were also designated as premium traditional cigar users.¹⁵ Conversely, users who could not be identified based on their reported usual brand and who reported paying \$2.00 or less per cigar were designated as non-premium traditional cigar smokers. Corey et al (2018) chose this threshold because 90% of users of the cigar brands identified as having characteristics of premium cigars reported paying \$2.00 or more per cigar; in addition, 85% of users of cigar brands identified as having non-premium cigar characteristics reported paying less than this amount per cigar. While this approach yields more participant records than identified in the original July 2018 report, the resulting weighted estimates are not considerably different (See additional commentary on this topic in Section 2.4).

Cigar use. Current use by adults is defined in the PATH Study as those who currently used the cigar type “every day” or “some days.”

Current use for youths is defined differently and requires only past 30-day use of cigar products. For the purposes of this report, youth cigar smokers are defined as past 30 day “not light” smokers who have smoked at least 10 cigars in their lifetime. The “not light” requirement was used because brand and product information were only asked of “not light” users.

Cigarette use. Current adult users of cigarettes are identified in the PATH Study as currently using these products “every day” or “some days.” A minimum level of lifetime use (≥ 100 cigarettes) is also required for current established cigarette users. Former adult cigarette smokers are defined as those adult participants who have smoked at least 100 cigarettes in their lifetime and do not now smoke cigarettes. Never cigarette smokers are those adult participants who have smoked fewer than 100 cigarettes in their lifetime.

Current youth cigarette smokers are defined somewhat differently in PATH by requiring only past 30-day use. For purposes of this report, as for youth cigar users, youth cigarette smokers are defined as past 30

not factored in to distinguish premium from non-premium cigar smokers. See pages 15-17 from the July 2018 report for additional details.

¹⁵ Price paid information is not available for the youth datasets.

day “not light” smokers who have smoked at least 10 cigarettes in their lifetime. This requirement was adopted to promote comparability across products.

1.3 Analyses

Descriptive and cross-sectional analyses used weights corresponding to the appropriate wave. Longitudinal analyses used the predicted wave weights in accordance with PATH Study recommendations. Sex (male, female), age, race/ethnicity (White, non-Hispanic, Black, non-Hispanic, Other, non-Hispanic, Hispanic), education (less than high school, General Educational Development [GED], high school, some college or associate degree, bachelor’s degree or more advanced degree), and household poverty and income level were summarized as provided in the datasets. Missing data on these variables were not imputed. However, so-called “imputed” versions of demographic variables were used where available as recommended by the PATH research team (Westat). These variables typically make reasonable inferences based on other PATH Survey documentation to make assignments for otherwise missing sex, age, or race/ethnicity variables, for example.

PATH data public use files (PUFs) were downloaded from the Inter-university Consortium for Political and Social Research (ICPSR 36498 V18 and ICPSR 37786 V8, accessed 2023-09-23)¹⁶. All calculations were performed using R 4.2.1¹⁷ (R Core Team 2020) and the *survey* package^{18 19} to generate weighted estimates to represent the US civilian, noninstitutionalized adult (18+) and youth (12-17) populations. Estimated standard errors and 95% confidence intervals (CIs) were calculated using the balanced repeated replication method (McCarthy 1969) with Fay’s adjustment set to 0.3 to increase estimate stability (Judkins 1990) as recommended in the PATH documentation.

1.4 Analyses Differences Between Reports

As in the July 2022 Report, the analyses detailed in this report were carried out to align with those described in the July 2018 Report as closely as possible. Deviations were required, however, largely due to subtle but important differences in the source data used for the respective analyses. PUFs were used for the analyses described in the July 2022 Report and the current report whereas restricted-use files (RUFs) were used in those analyses detailed the July 2018 report. Use of the RUFs requires prior administrative approval and can only be accessed and operated upon behind ICPSR firewalls. Furthermore, a disclosure review process is required prior to exporting results from the ICPSR computing environment.

Given that the planned analyses did not require data elements unique to the RUFs (e.g., participant state of residence, biomarker data, tobacco product UPC data), the more readily accessible PUFs were relied

¹⁹ Lumley, T. (2020). "survey: analysis of complex survey samples". R package version 4.0.

on for the analyses detailed in the July 2022 Report and here. There are, however, three important differences in the data files, including data fields that appear in both sets of files as detailed in Table 2. Two differences relate to increased granularity (specifically with respect to reporting of participant age) and subtle idiosyncrasies of RUFs compared to PUFs. These differences do not practically impact data analysis results. One other difference, however, is substantive. Briefly, the PUFs offer less granularity regarding cigar brand and product names, with many PUF participant records reporting simply “Some other brand [or product]”. To counter potential undercounting of cases, Corey et al.’s (2018)⁴ price per cigar criteria was also incorporated to identify premium cigar users (see Section 2.2 for additional details). This approach can be considered as more conservative than the approach used in the July 2018 report relying on reported brand/product name alone. Slightly more premium cigar user records were identified, thus yielding more of a “worst-case” analysis than the analysis presented in the July 2018 report.

Due to these data source differences (outlined further in Table 2), all Wave 1 through Wave 3 calculations were replicated and presented alongside the Wave 4 through Wave 6 calculations to improve comparability across estimates for each wave. As noted in Section 2.2 and again in Table 2, while subcategorization of traditional cigars yielded increased numbers of records for premium and non-premium cigar users, the corresponding weighted estimates did not differ substantially when PUFs were analyzed, nor did the key take-aways or interpretation. *In summary, while methods used to identify premium cigar users differed somewhat, differences in specific results were negligible and conclusions were identical to those detailed in the July 2018 Report.*

Table 2. Differences between RUFs and PUFs and their Practical Impact on Analyses

Difference between RUF and PUF data	Practical Impact on Analytic Results
<p>1. RUFs include more traditional cigar brand/product information that is abstracted in PUFs (e.g., reported as “Some other brand [or product]”</p>	<ul style="list-style-type: none"> This difference means that less-specific brand/product information is available to subcategorize traditional cigar users into premium versus non-premium users. As a result, less premium cigar user records are identified based on brand/product name alone. For example, the Wave 1 PUFs indicate 272 premium cigar user records, whereas the original July 2018 report identified 315 such participant records using the RUFs. For this reason, the \$2.00 price paid per cigar threshold was used as a secondary criterion to identify premium cigar users in the PUFs. More premium cigar records are identified, as a result (PUF n=340 vs RUF n=315) by adding this criterion, but the weighted estimates do not differ substantially.
<p>2. RUFs include exact participant ages, whereas PUFs abstract ages to age ranges</p>	<ul style="list-style-type: none"> Age of first regular use and current age of participant summaries are tabulated as age categories in this report (Figure 6 and Appendix C, Table C-5 herein) rather than point estimates in the July 2018 report Table 5. The resulting summaries provide a better reflection of the entire age distributions, however, and could thus be considered an improvement upon the original July 2018 report summaries. The first product initiated among dual users of premium cigars and cigarettes table is less precise in this report (Table 5) since age ranges are compared rather than the specific point estimates used to compile Table 8 on page 36 of the original July 2018 report. This results in a larger share of

	<p>participants indicating initiation at the same age but is otherwise consistent with the key finding that initiation of premium cigars first is rare.</p>
<p>3. RUFs contain more information that, in principle, could be used to identify participants; values are swapped for a small percentage of cases with otherwise similar characteristics in the PUFs to reduce the likelihood of participant identification</p>	<ul style="list-style-type: none"> As noted on the <i>PATH Study Public Use Files User Guide</i> (page 1), these modifications do not affect overall data quality, but may result in PUF-based estimates that differ slightly (e.g., fraction of percentage points in prevalence estimates and CIs) from those created using the PATH RUFs.

2 RESULTS

As presented in the July 2022 Report update, findings of the updated analyses presented here are organized in the same manner and under the same subheading names as those used in the July 2018 Report. For further ease of comparison between the two sets of analyses, Table A- 1 in Appendix A maps the July 2018 Report results (Tables 1 through 10 and Table 12) to the corresponding figures and tables in this report. While the calculations were conducted to match as closely as possible those in the July 2018 report, some of the output was consolidated into graphical plots to simplify review of results and facilitate comparisons across waves. Specific point estimates, CIs or IQRs, and number of records upon which estimates are based are tabulated for all figure plots (Figures 2-7 and Figure B- 1) in corresponding Appendix C tables.

The January 2024 Report, similar to the July 2018 Report and the July 2022 Report, presents data on “overall premium cigars” and “unflavored premium cigars.” *It does not directly present data on “flavored premium cigars” simply and only because the number of data records (reflecting prevalence of use) available for this category is so low that reliable statistical calculations cannot be performed on a “flavored premium cigar” dataset.* As demonstrated throughout this report, the premium cigar analysis shows no statistically significant differences whether looking at “overall premium cigars,” “unflavored premium cigars,” or (by extension) “flavored premium cigars.”

2.1 Prevalence of Youth Cigar Usage, Wave 1 – Wave 6

Consistent with the original July 2018 Report and the July 2022 Report, youth past 30 day, “not light” use of cigars continued to be extremely low in Wave 5.5 and 6 (Figure 2 and Appendix C, Table C- 1). ***In fact, and as was the case for Waves 4, 4.5, and 5, not a single youth participant reported smoking premium cigars in Waves 5.5 and 6.*** In addition, and for comparison purposes only, when looking at the PATH data through Wave 6, it is apparent that even though continuing to decline, “not light” cigarette smoking in US

youth is notably higher relative to youth cigar smoking of any type (and particularly so when compared to premium cigars of which there is no reported youth usage in the later data Waves).

Figure 2. Prevalence of Cigar Usage Among Youth Aged 12-17, Wave 1 to Wave 6.

PATH Estimates for 'Not light' Cigar & Cigarette Use Among US Youth, Wave 1 - Wave 6

Note: The "Premium Cigars – Overall" estimates are nearly identical to those for "Premium Cigars – Unflavored". As such the "Premium Cigars – Unflavored" curve is completely masked as it sits underneath the "Premium Cigars – Overall" curve.

*Importantly, premium cigar estimates for Waves 4 through 6 are set to zero because 'not light' (i.e., lifetime use of more than 10 cigars) youth premium cigar use was not detected in Waves 4, 4.5, 5, 5.5, or 6. Three records each in Wave 4 and Wave 4.5 as well as one record each in Wave 5.5 and 6 report past 30-day youth use of premium cigars. None were flavored premium cigars, and the corresponding participants reported consumption of ten traditional cigars or less in their lifetime, thus failing to meet the 'not light' use criteria.

Figure 2 Alternative (bar chart instead of line chart). Prevalence of Cigar Usage Among Youth Aged 12-17, Wave 1 to Wave 6.

PATH Estimates for 'Not light' Cigar & Cigarette Use Among US Youth, Wave 1 - Wave 6

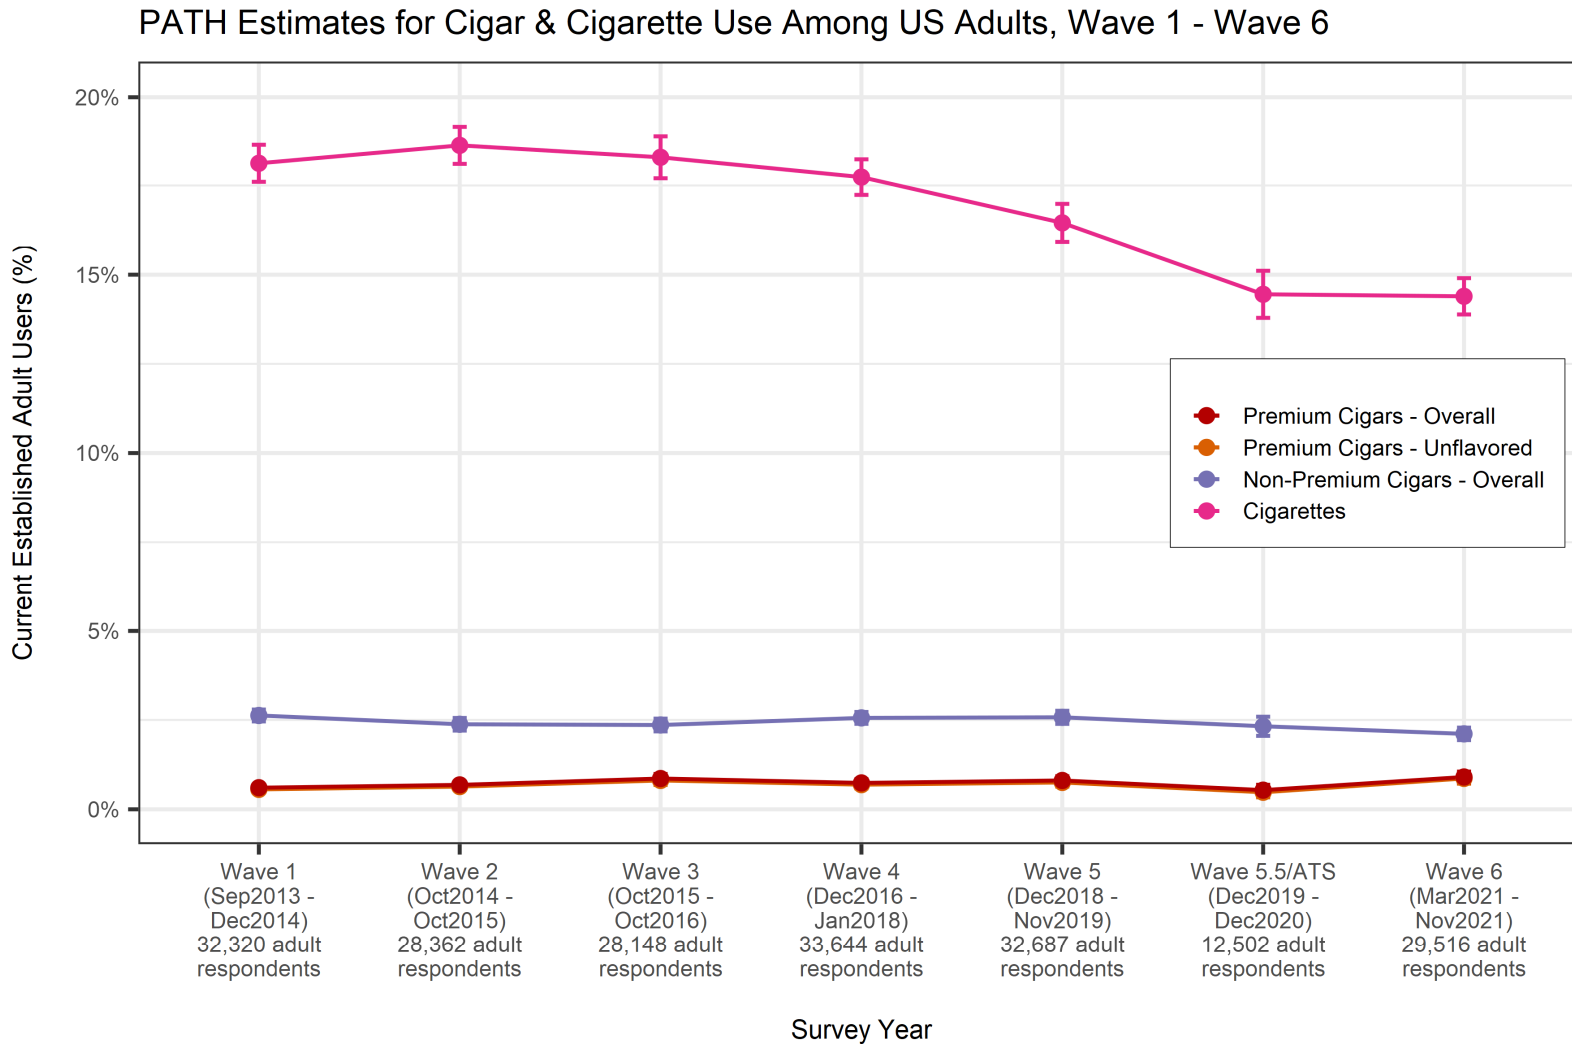

2.2 Prevalence of Adult Cigar Usage, Wave 1 – Wave 6

Trends in adult use of cigars continued to follow a similar pattern to those recognized in the July 2018 Report and July 2022 Report (Figure 3 and Appendix C, Table C- 2). Premium cigar use (overall and unflavored, and by extension flavored) among US adults remained at less than 1%. Use of all non-premium cigars was approximately 2% to 2.5%, and use of cigarillos was 1.5%. Cigar use of any type remained considerably lower than cigarette smoking.²⁰

²⁰ Cigarette smoking continued declining in Waves 5.5/PATH-ATS and Wave 6, with the most current data indicating less than 14.5% of US adults as current established cigarette smokers.

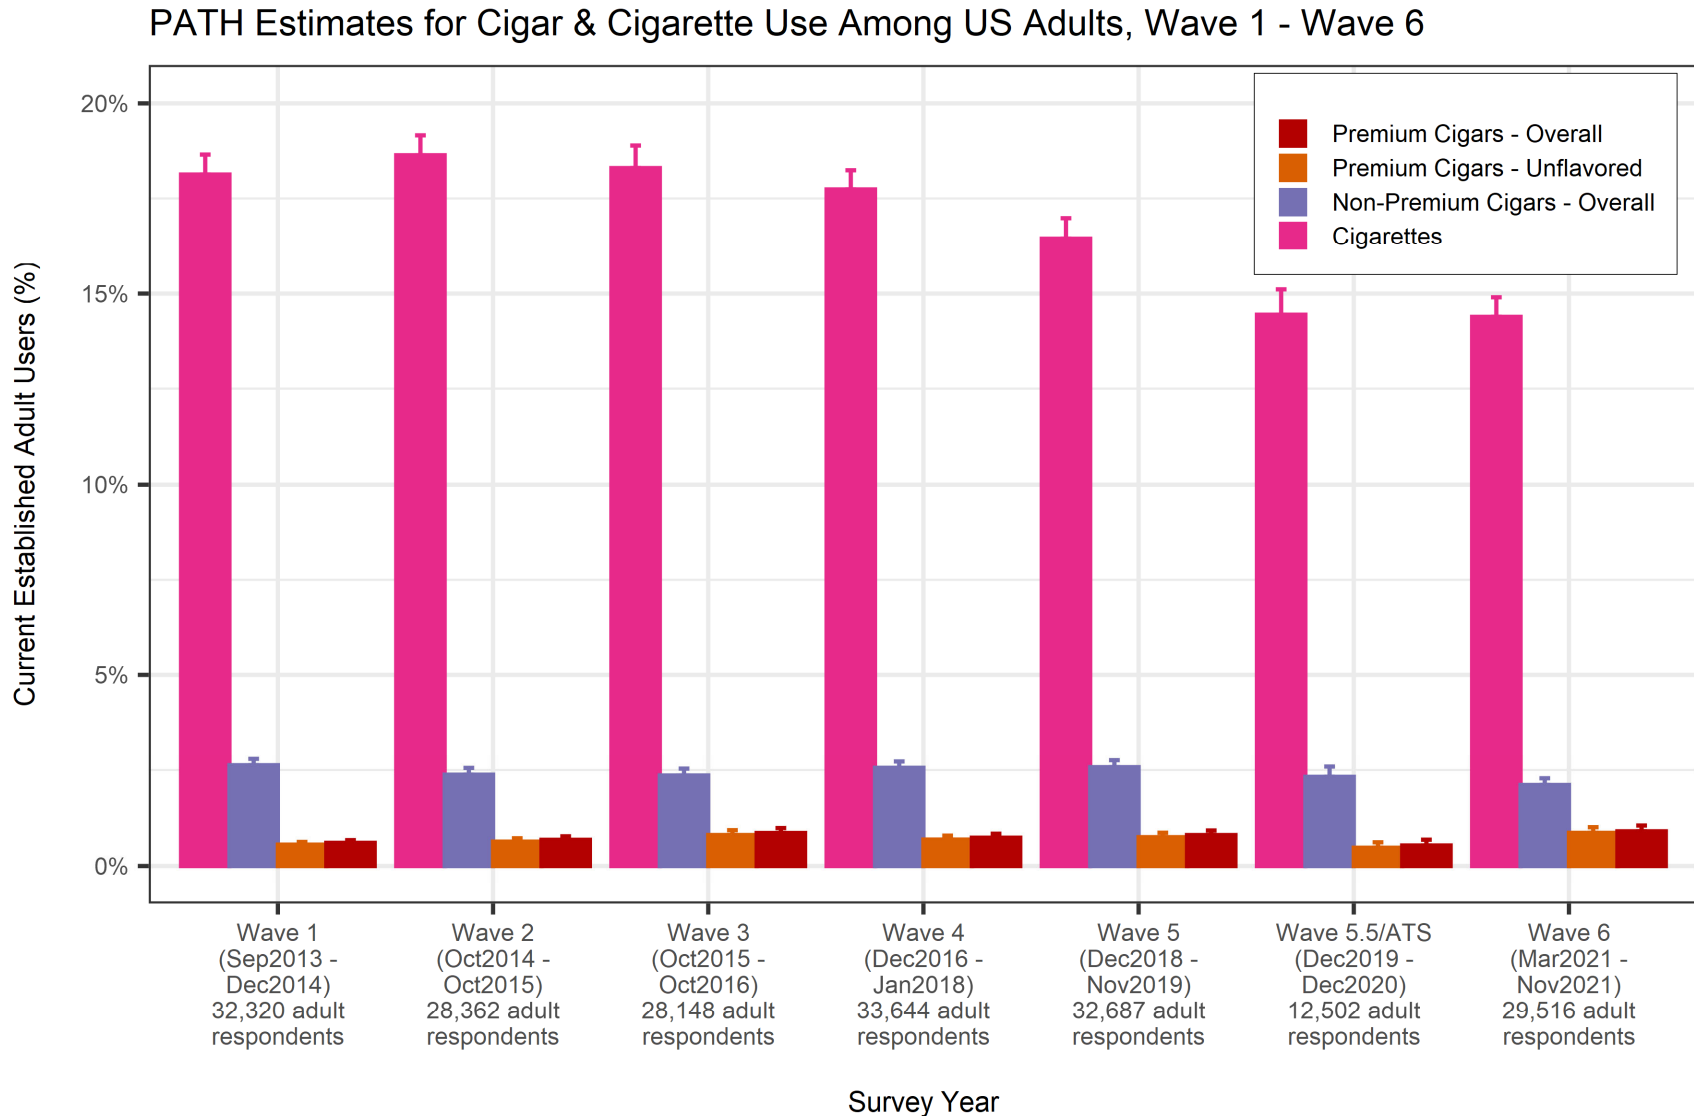

Figure 3. Prevalence of Cigar Usage Among Adults, Aged 18 Years and Older, Wave 1 to Wave 6.

Note: The "Premium Cigars – Overall" estimates are nearly identical to those for "Premium Cigars – Unflavored". As such the "Premium Cigars – Unflavored" curve is nearly completely masked as it sits underneath the "Premium Cigars – Overall" curve.

Figure 3 Alternative (bar chart instead of line chart). Prevalence of Cigar Usage Among Adults, Aged 18 Years and Older, Wave 1 to Wave 6.

2.3 Demographic Characteristics of Cigar and Cigarette Users, Wave 1 – Wave 6

Demographic characteristics of premium cigar users remained largely unchanged through all Waves of PATH data. Premium cigar users (both overall and unflavored, and by extension flavored) are typically white males, more than 50% are 35 years or older (ranging across Waves between 53% to a high of 68% in Wave 6), generally well educated, and financially well-off (Appendix B, Figure B- 1 and Appendix C, Table C- 3). Notably, young adult (ages 18-24) use of premium cigars has declined considerably through the Waves. At Wave 1 (2013/14) approximately 20% of premium cigar users were aged 18-24 whereas in Wave 6 (2021) less than 3% of premium cigar users were in the young adult category.

While users of all cigars and cigarettes continued to be predominately male, the skew remained most dramatic for premium cigars where for both overall and unflavored, approximately 95% or more of users were male across all waves. Users of non-premium traditional cigars were approximately 85% male across all waves. By comparison, cigarillo and filtered cigar users were approximately 70% male, with cigarette users at approximately 54% male.

Across all Waves of data, the demographic trends stayed relatively consistent.²¹ Approximately 70-80% of premium cigar users (both overall and unflavored, and by extension flavored) continued to be white, non-Hispanic, and 5-10% were black, non-Hispanic. By comparison, cigarillo users continued to be the most diverse with respect to race/ethnicity with a more even split of black and white non-Hispanic users (approximately 42-47% and 35-37%, respectively, in Waves 4-6). Non-premium traditional and filtered cigar users were 55-60% white, non-Hispanic and approximately 15-25% black, non-Hispanic, and cigarette smokers nearly 70% white, non-Hispanic and approximately 13% black, non-Hispanic. Other or multi-race non-Hispanics comprised approximately 5-10% of users across all examined tobacco products, and Hispanics varied from 10-15% of non-premium cigar and cigarette users. Hispanic use of premium cigar use was 10% or less from Wave 1 through Wave 5.5/PATH-ATS, with an increased point estimate of approximately 18% in Wave 6. However, in the Wave 6 data the 95% confidence interval is wide (8.8% -- 27.1%) indicating estimate instability due to relatively limited data (n=40 records were available). In other words, there were too few samples to calculate a narrower CI.

Premium cigar users (both overall and unflavored, and by extension flavored) were notably more educated than all other examined tobacco product users with nearly 50% completing college or a more advanced degree. By comparison, 10-15% of cigarette smokers, cigarillo users, and non-premium traditional cigar users had similar education levels. Approximately 10% of filtered cigar users completed college or a more advanced degree. These trends were consistent through all six Waves.

Measures of financial status followed a similar pattern of stability through the six Waves of data. More than 60% of premium cigar users (both overall and unflavored, and by extension flavored) were at or above twice the federal poverty level (reported only for Wave 1), and nearly 30-40% reported household income of \$100,000 or more across all Waves. In contrast, only one-third or less of all other tobacco user

²¹ As in the July 2018 Report and July 2022 Report, youth use of these products could not be investigated further due to the low prevalence (virtually non-existent reporting) of youth usage of premium cigars. In fact, as noted previously, there were zero participant records indicating past 30-day premium cigar use among youth who smoked more than 10 premium cigars in their lifetime reported in Waves 4, 4.5, 5, 5.5, or 6. Further analysis of youth demographic or frequency/intensity data was not statistically possible, and thus such analyses were performed only for adult usage of premium cigars.

groups were at or above twice the federal poverty level, and approximately 90% or more reported household income of \$100,000 or less across all waves.

2.4 Frequency and Intensity of Premium Cigar Use, Wave 1 – Wave 6

Trends in frequency and intensity of tobacco use have remained consistent throughout all Waves of PATH data. Adult premium cigar users²² (both overall and unflavored, and by extension flavored) were generally not everyday users, tended to smoke only 1-2 days per month, and generally smoked only 1-2 premium cigars on those days (Figure 4, Figure 5, and Appendix C, Table C- 4).

Specifically, approximately 95% of premium cigar users do not smoke every day.²³ Indeed, across all PATH Waves (excepting Wave 5.5/PATH-ATS), a range of 93.6% to 96.4% of premium cigar users smoked premium cigars less than daily; with 98.4% of Wave 5.5/PATH-ATS premium cigar users smoking premium cigars less than daily. Everyday use of non-premium traditional cigars and cigarillos was 15-25%, with everyday use of filtered cigars at approximately 40% of users. Everyday use of cigarettes remained by far the highest among the examined products at approximately 75%-80%.

Consistent with the everyday use findings, the median number of smoking days in the past month for premium cigar users (both overall and unflavored, and by extension flavored) varied between 1 and 2 for all Waves except Wave 5.5/PATH-ATS, in which it was 0. In comparison, the estimate for nonpremium cigars ranged from 3-5 smoking days per month for traditional cigar and cigarillo users, approximately 20 smoking days per month for filtered cigar users, and 30 smoking days per month for cigarette smokers.

On those smoking days, premium (both overall and unflavored, and by extension flavored) cigar smokers smoked a median of 1 cigar per day. Non- premium traditional cigar and cigarillo users indicated use of a median of 1-2 cigars smoked per day. The median was greater for filtered cigar users at 4-5 per day on days smoked, and notably increased to 10 per day on days smoked for cigarette smokers.

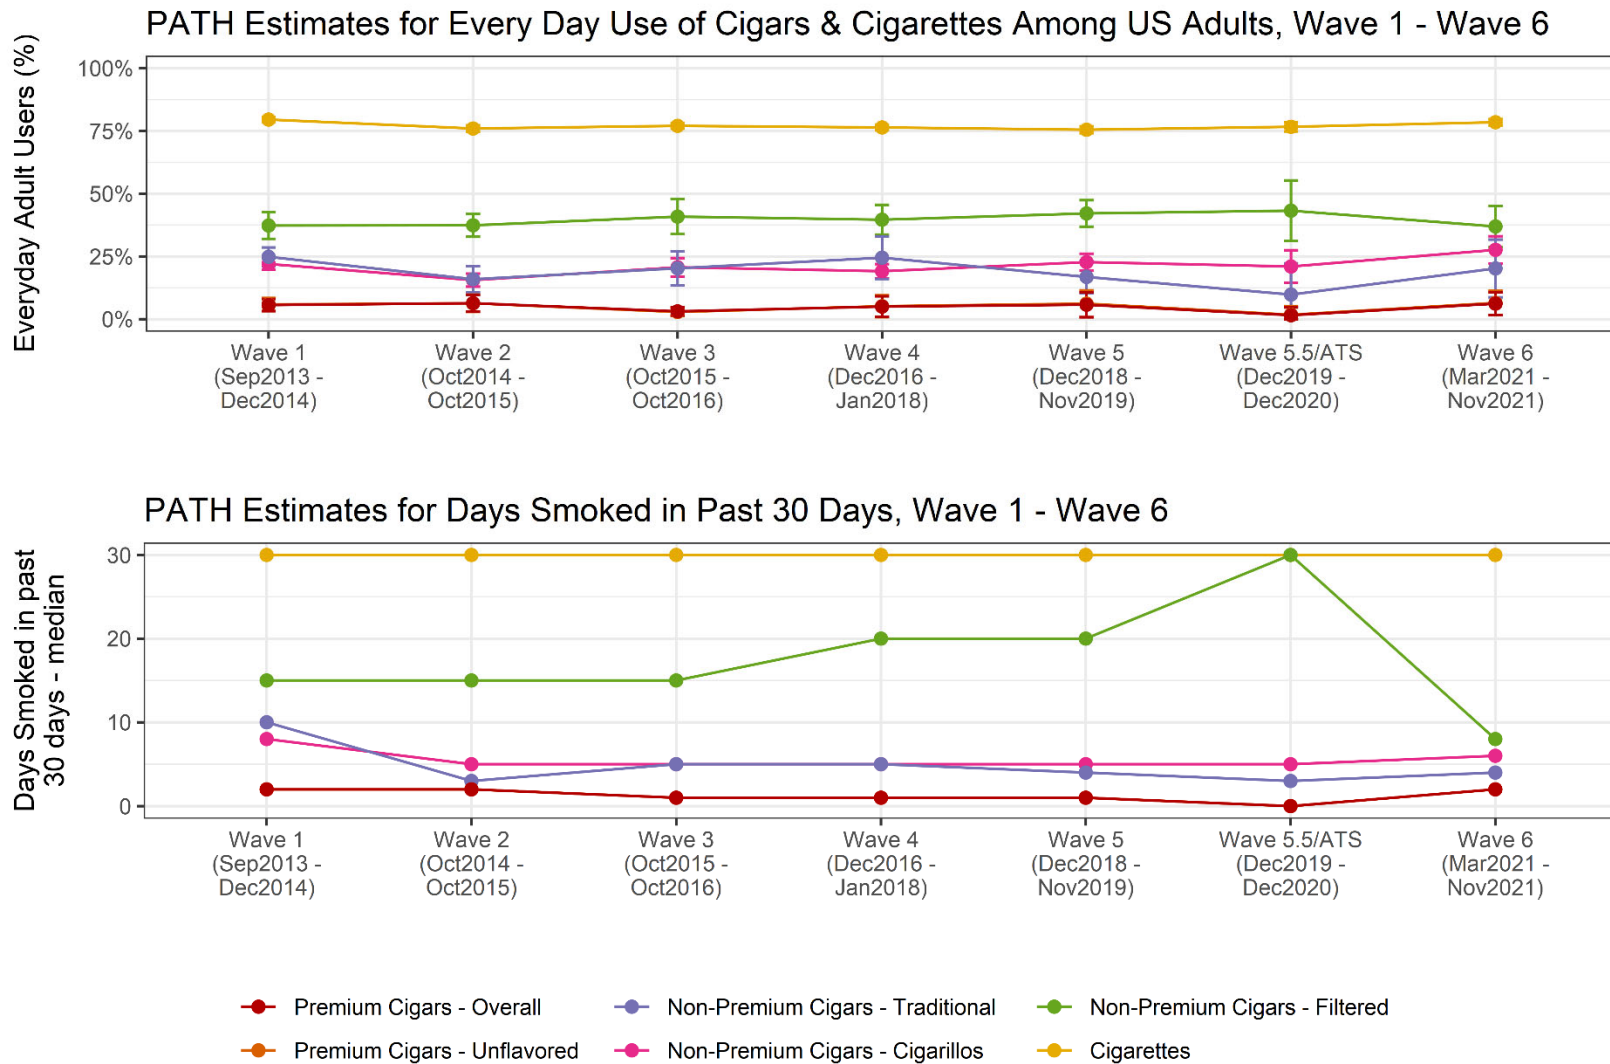

When examining past 30-day use (i.e., across both smoking and non-smoking days), the estimates decreased considerably to near zero for premium cigar users (for both overall and unflavored, and by extension flavored). Additionally, these estimates fall to considerably less than 1 for nonpremium traditional cigar and cigarillo users. Filtered cigar use estimates were also reduced to approximately 3 per day in the past 30 days, and the cigarette estimate was unchanged²⁴ remaining at 10.0 per day in the past 30 days.

²² As in the July 2018 Report and July 2022 Report, youth use of these products could not be investigated further due to the low prevalence (virtually non-existent reporting) of youth usage of premium cigars. In fact, as noted previously, there were zero participant records indicating past 30-day premium cigar use among youth who smoked more than 10 premium cigars in their lifetime reported in Waves 4, 4.5, 5, 5.5, or 6. Further analysis of youth demographic or frequency/intensity data was not statistically possible, and thus such analyses were performed only for adult usage of premium cigars.

²³ Note that these estimates are based on relatively few participant records (ranging from 1 to 21 records depending on the Wave).

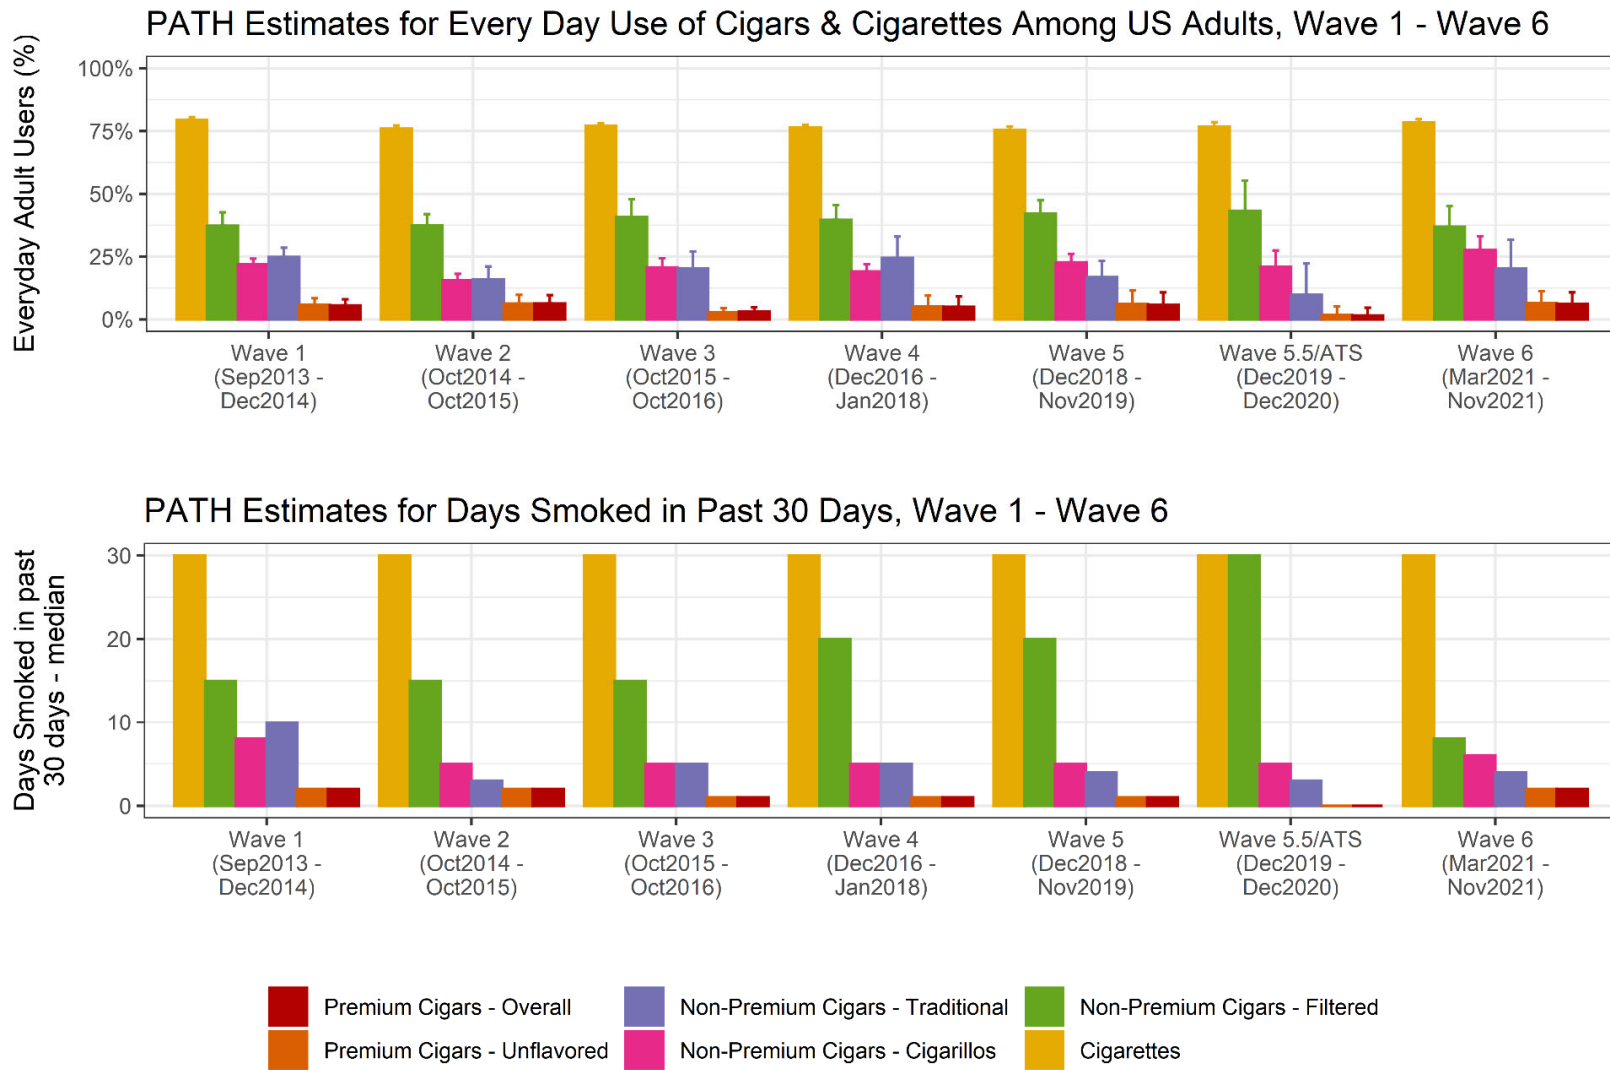

²⁴ This finding for cigarette smokers is not surprising given that approximately 75%-80% report everyday smoking.

Figure 4. Frequency of Tobacco Use by Cigar Type and Cigarettes, Wave 1 to Wave 6.

Note: In the bottom subplot, only point estimates for the median are shown as the IQR estimates are wide with considerable overlap across products. The corresponding table (Appendix C, Table C- 4) reports median, IQR, and number of corresponding participant records.

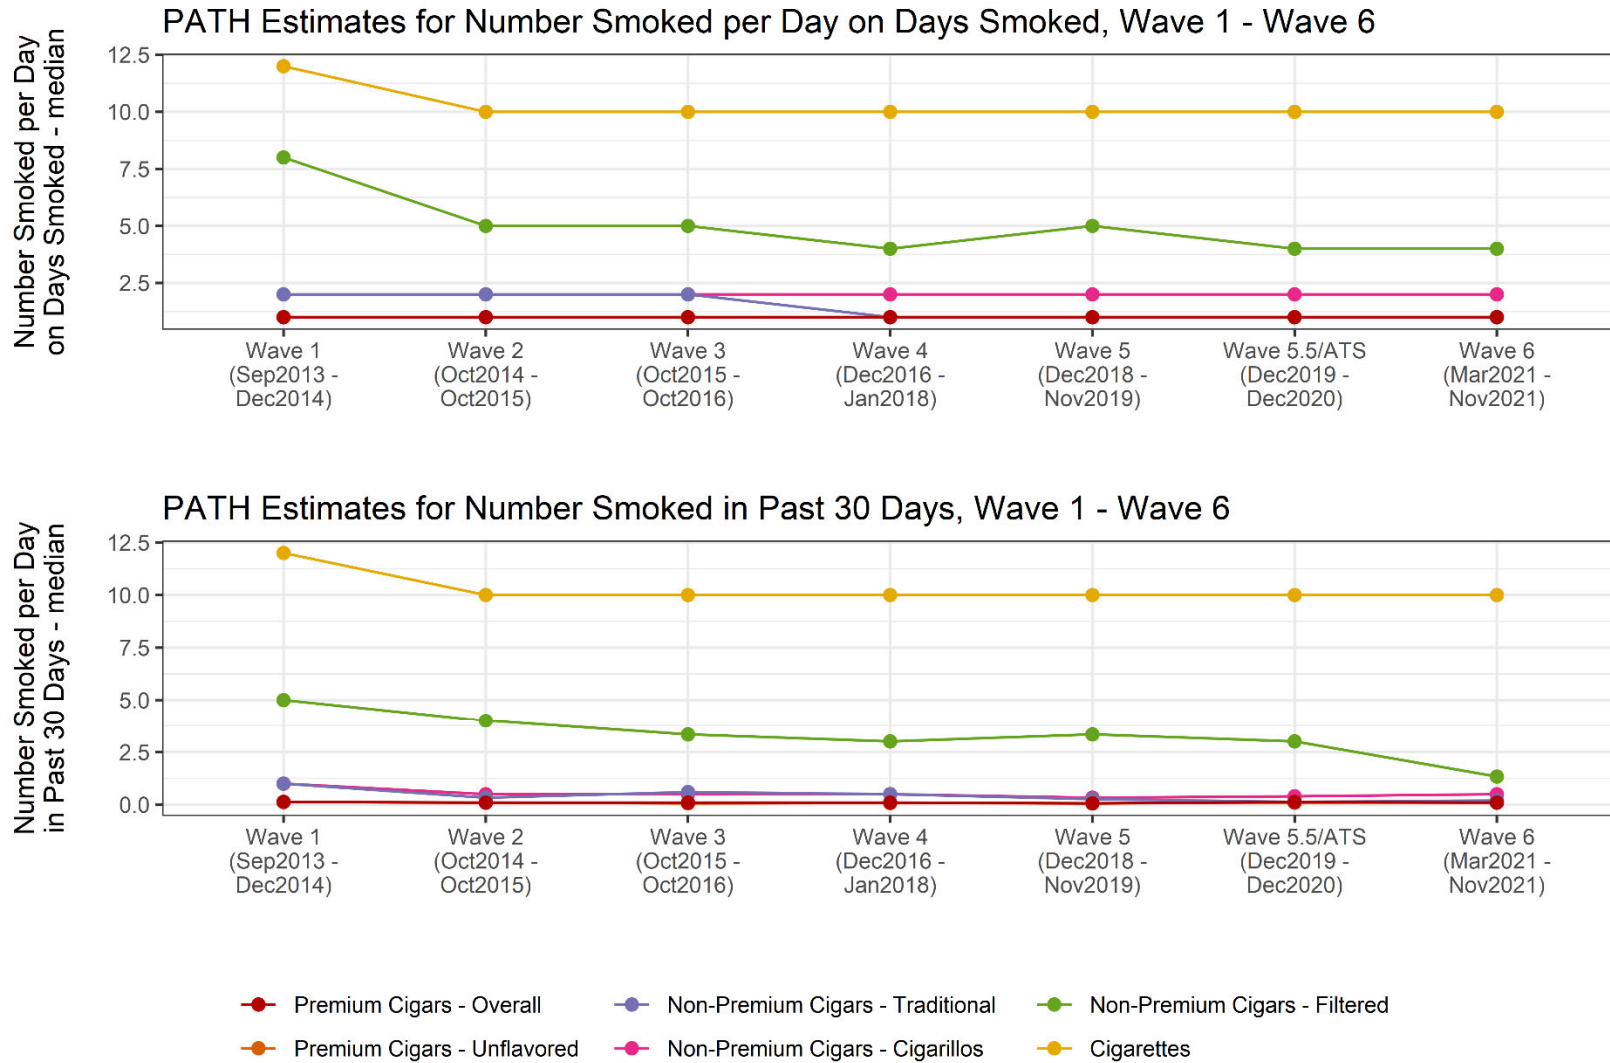

Figure 4 Alternative (bar charts instead of line charts). Frequency of Tobacco Use by Cigar Type and Cigarettes, Wave 1 to Wave 6.

Note: In the bottom subplot, only point estimates for the median are shown as the IQR estimates are wide with considerable overlap across products. The corresponding table (Appendix C, Table C-4) reports median, IQR, and number of corresponding participant records.

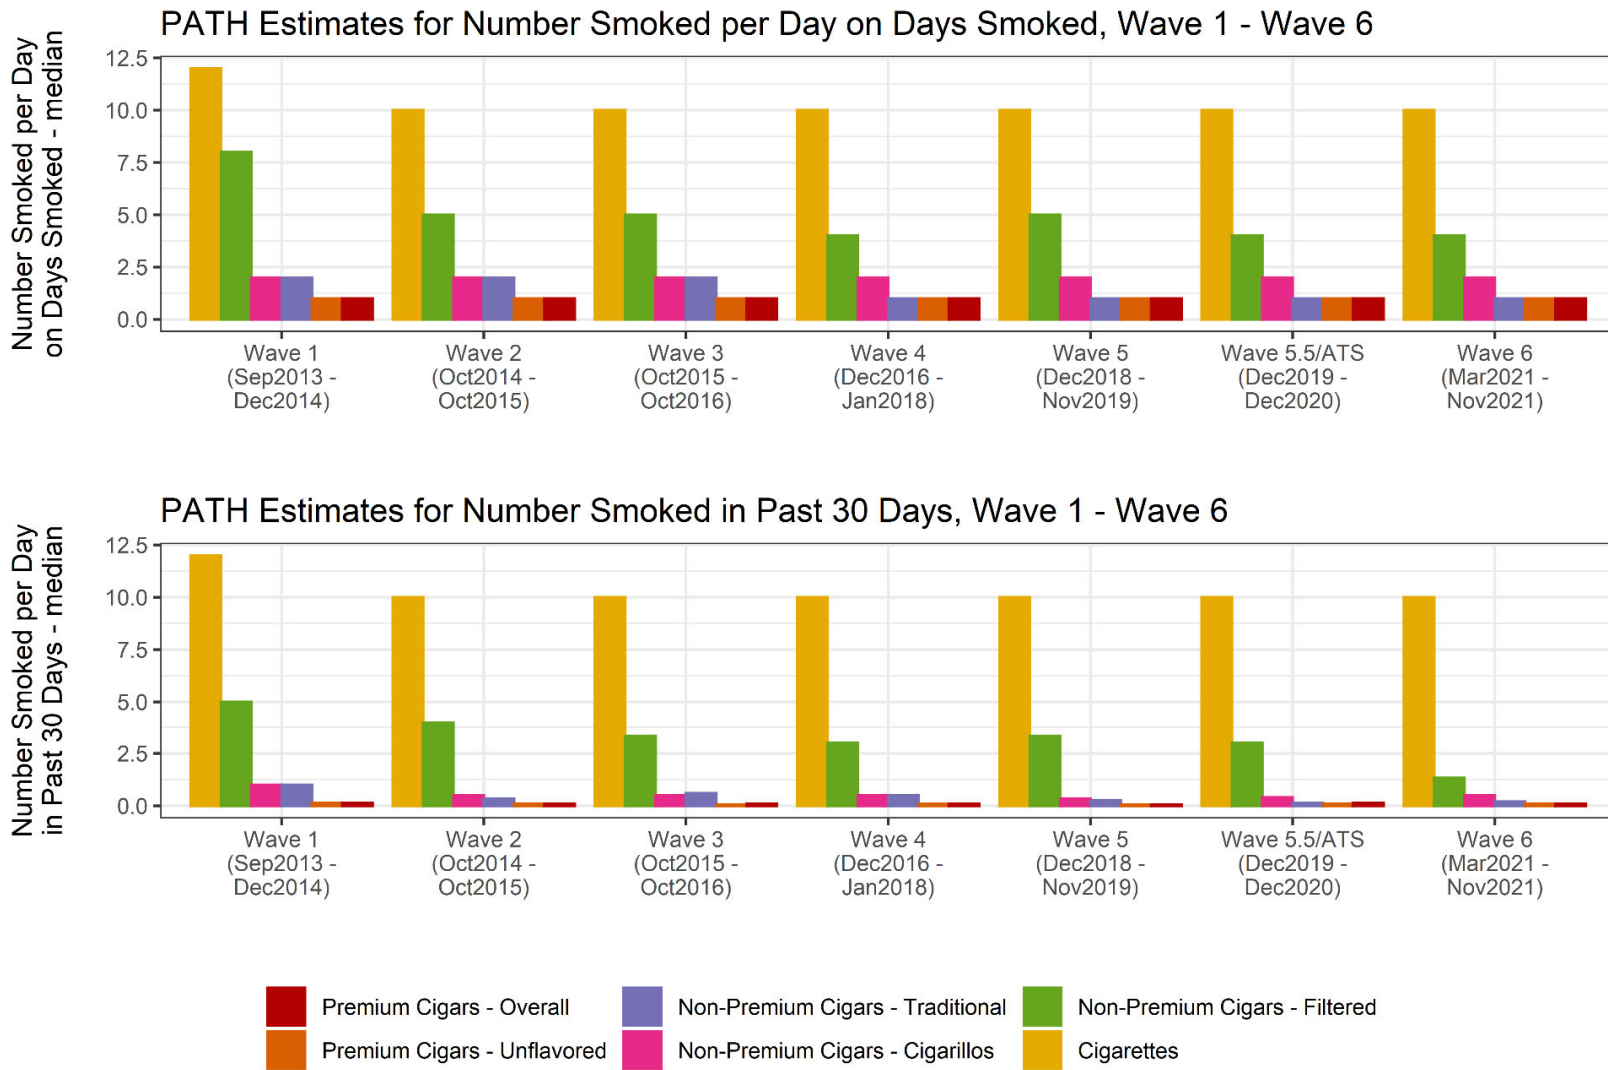

Figure 5. Intensity of Tobacco Use by Cigar Type and Cigarettes, Wave 1 to Wave 6.

Note: Only point estimates for the median are shown as the IQR estimates are wide with considerable overlap across products. The corresponding table (Appendix C, Table C-4) reports median, IQR, and number of corresponding participant records for each parameter.

Figure 5 Alternative (bar charts instead of line charts). Intensity of Tobacco Use by Cigar Type and Cigarettes, Wave 1 to Wave 6.

Note: Only point estimates for the median are shown as the IQR estimates are wide with considerable overlap across products. The corresponding table (Appendix C, Table C-4) reports median, IQR, and number of corresponding participant records for each parameter.

2.5 Premium Cigars, Tobacco Initiation and Progression of Use of Other Tobacco Products, Wave 1 – Wave 6

As in the July 2018 Report and the July 2022 Report, tobacco use initiation and progression to regular cigarette use was examined using all currently available PATH data through Wave 6. Age at first use, transition from cigar to cigarette smoking, and product first used among dual premium cigar and cigarette smokers are presented separately in the three subsequent subsections.

2.5.1 Age at Initiation

Age at initiation of tobacco product use was examined based on the age of reported first “fairly regular” use of cigarettes or cigars²⁵. As noted in section 2.4 and Table 2, the PUFs provide age categories rather than the exact ages that are available in the RUFs that were used in the original July 2018 Report. As such the corresponding output in the July 2022 Report update as well as this January 2024 Report (Figure 6 and Appendix C, Table C- 5) differs in composition from its Table 5 counterpart on pages 31-33 of the original July 2018 Report. Nevertheless, the resulting summaries herein could be viewed as more useful in that they display a more comprehensive perspective of the initiation age distribution.

Consistent with the original July 2018 Report and July 2022 Report, initiation of first regular use of premium cigars (both overall and unflavored, and by extension flavored) is skewed older than all other examined product types (Figure 6 and Appendix C, Table C- 5). Approximately 90% of current adult premium cigar users initiated regular use at 18 years or older and more than 50% initiated regular use at 25 years or older based on data through Wave 5.5/PATH-ATS. The Wave 6 estimate for age of premium cigar use initiation at less than 18 years old was higher than all previous Waves at 17.3%. This estimate, however, was based on limited data (n=13 corresponding participant records) and has a wide confidence interval (5.3% 0 29.3%). As such, continued monitoring is required to determine if this increase reflects a novel trend, or numerical instability due to limited available data.

By comparison, across all Waves of PATH data approximately 20-30% of non-premium traditional cigar, cigarillo, and filtered cigar users initiated regular use at less than 18 years old. In contrast to all cigar types, regular cigarette smoking was initiated at less than 18 years old for approximately 55% of cigarette smokers, and 90%-95% at less than 25 years old in aggregate.

²⁵ The “AC1007” variables were used to assess age when first started cigarette smoking fairly regularly, and the “AG1007” variables were used to assess age when first started using cigars fairly regularly. Summary variables were derived to integrate new baseline participant data with the corresponding responses from previous waves as needed.

Figure 6. Initiation Age at First Regular Use by Cigar Type and Cigarettes, Wave 1 to Wave 6.

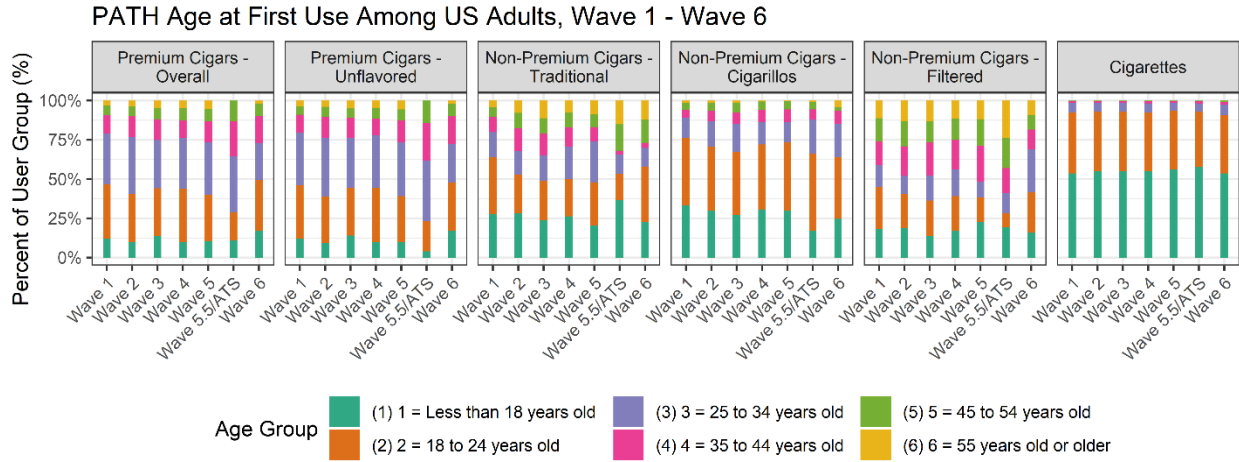

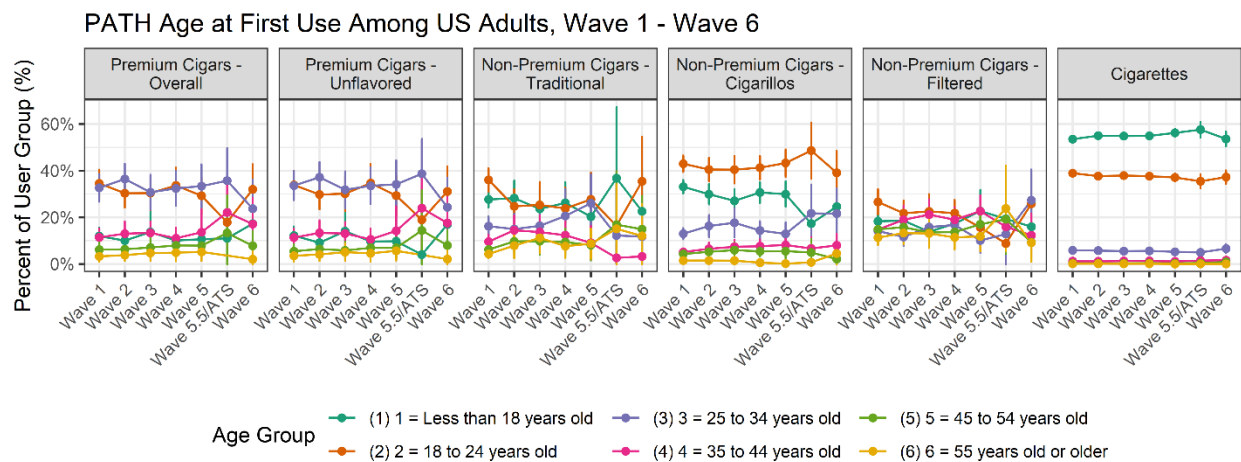

Figure 6 Alternative (line charts instead of stacked bar charts). Initiation Age at First Regular Use by Cigar Type and Cigarettes, Wave 1 to Wave 6.

2.5.2 Progression to Everyday Cigarette Smoking

As in the July 2018 Report and the July 2022 Report, the longitudinal nature of PATH was leveraged to investigate cigar users' progression from non-regular to regular cigarette smoking. Following the original paradigm, the number of Wave 1 cigar smokers that did not smoke cigarettes regularly but became regular smokers by Wave 3, Wave 5, and Wave 6 was examined (Section 3.5.2.1). In addition, current dual users of premium cigars and cigarettes were assessed to determine which product was used first (Section 3.5.2.2).

In Wave 4, the Wave 1 Cohort was replenished with a new sample of participants to supplement the Wave 1 sample and account for aging and to replace participants who dropped out of the study.²⁶ Accordingly, both sets of analyses aimed at examining progression to cigarette smoking were repeated to assess progression to everyday smoking between Wave 4 and Wave 5 as well as Wave 4 and Wave 6.

²⁶ The *PATH Study Public Use Files User Guide* provides further detail on the rationale and procedures followed for the Wave 4 replenishment sample (see especially Chapter 1.1, Chapter 2.0, and Chapter 2.3).

2.5.2.1 *Current Cigar Smokers Transition to Regular Cigarette Smoking*

The top section of Table 4 summarizes the extent to which cigar smokers who did not smoke cigarettes every day in Wave 1 progressed to everyday smoking in Wave 3, replicating the analysis that appears in the RUF-based Table 6 of the original July 2018 report. The PUF-based analysis herein similarly found that progression to everyday smoking was rare among premium cigar users (approximately 2% with only 5 such participant records identified). Among nonpremium traditional cigar and cigarillo users such progression was approximately 10% and was approximately 26% among filtered cigar users. Notably, progression to everyday cigarette smoking for premium cigar users was similar to that of Wave 1 results of 1.1% (CI: 0.96-1.31%) for participants that did not report current use of any tobacco product (including ENDS, smokeless, and all other tobacco products also monitored in PATH).

The second section of Table 3 summarizes results from a similar analysis that examines Wave 1 progression to everyday cigarette smoking in Wave 5. Similar findings were obtained to the prior analysis, with premium cigar users who progressed to everyday cigarette smoking at Wave 5 (a lower rate than the 1% of Wave 1). In addition, there were only two such participant records identified, both unflavored premium cigars. The remainder of results were likewise consistent with the Wave 1 to Wave 3 analysis. Approximately 10% of Wave 1 nonpremium traditional cigar and cigarillo users with Wave 5 follow-up data progressed to everyday cigarette smoking. In addition, approximately 24% of Wave 1 filtered cigar users progressed to everyday cigarette smoking.

The third section of Table 3 summarizes results from an analysis that examines Wave 1 progression to everyday cigarette smoking in Wave 6. Again, premium cigar users rarely progressed to everyday cigarette smoking (1.98% with only 3 such participant records identified all of which used unflavored premium cigars). The remainder of results were likewise consistent with the Wave 1 to Wave 3 and Wave 1 to Wave 5 analysis. Similar to the other Wave 1 progression analyses, approximately 10% of Wave 1 nonpremium traditional cigar and cigarillo users with Wave 6 follow-up data progressed to everyday cigarette smoking. In addition, approximately 12% of Wave 1 filtered cigar users and 1% of Wave 1 participants who were not current tobacco users progressed to everyday cigarette smoking.

The fourth and fifth sections of Table 3 (appearing on page 35) summarize results from similar analyses of Wave 4 current cigar smokers that did not smoke cigarettes every day and their progression to everyday cigarette smoking in Wave 5 and Wave 6. Similar findings to the Wave 1 progression analyses were observed with premium cigar users rarely progressing to everyday smoking. Approximately 1.5% of this Wave 4 subgroup (n=5 participant records) progressed to everyday smoking in Wave 5 and zero relevant participant records were identified in Wave 6. Approximately 5%-10% of nonpremium traditional cigar and cigarillo users progressed to everyday smoking in Wave 5 or Wave 6, whereas filtered cigar users did so more frequently at approximately 20% in Wave 5 and nearly 14% in Wave 6. In addition, Wave 4 non-current tobacco users progressed to everyday cigarette smoking with comparable²⁷ rarity relative to premium cigar users at approximately 0.8% in both Wave 5 and Wave 6.

²⁷ “Comparable” in this case indicates that the 95% confidence intervals overlap. It is not meant to suggest that the point estimates are exactly equal or only minimally different.

Table 4 summarizes results from a similar set of analyses examining progression to some day or everyday smoking among cigarette non-smokers in a previous wave. Such progression was relatively rare among premium cigar smokers whether comparing Wave 1 to Wave 3 (6.01%, CI: 2.00-10.0%), Wave 1 to Wave 5 (6.22%, CI: 1.71-10.73%), or Wave 1 to Wave 6 (5.87%, CI: 1.09-10.66%). Analyses of Wave 4 to Wave 5 (4.01%, CI: 1.24-6.77%) and Wave 4 to Wave 6 (0.60%, CI: 0-1.47%) yielded similar findings. Again, progression to at least some day smoking from cigarette non-smoking was somewhat more common among nonpremium traditional cigar (approximately 12-13% for Wave 1 to Wave 3 or Wave 5 and Wave 4 to Wave 5; nearly 8% for Wave 1 to Wave 6 and approximately 17% for Wave 4 to Wave 6, although both of these latter estimates were based on only 10 or fewer records). Likewise, cigarillo user progression to everyday cigarette smoking was more common (approximately 13-18% for Wave 1 to Wave 3, Wave 5, or Wave 6, and approximately 13%-15% for Wave 4 to Wave 5 or Wave 6). Filtered cigar users again progressed more frequently at approximately 30% in the Wave 1 to Wave 3 or Wave 5 analysis and approximately 35% in the Wave 4 to Wave 5 analysis. Wave 1 to Wave 6 and Wave 4 to Wave 6 estimates for progression to everyday cigarette smoking among filtered cigar users was lower (approximately 10% and 15%, respectively) although both were based on approximately 10 participant records. Finally, progression to at least some day cigarette smoking among previous wave not current tobacco users was again comparable²⁷ to that of premium cigar users (approximately 2% for all Wave 1 and Wave 4 progression analyses).

Table 3. Progression among Current Cigar Smoker and Non-current Tobacco User from Not Everyday Cigarette Smoker to Everyday Cigarette Smoker, Wave 1 to Wave 3, Wave 5, and Wave 6, as well as Wave 4 to Wave 5 and Wave 6.

Parameter	Premium Cigars		Non-Premium Cigars			Not Current Tobacco Users
	Overall	Unflavored	Traditional	Cigarillos	Filtered	
Progression from Not Everyday Smoker in Wave 1 to Everyday Cigarette Smoker in Wave 3						
Not everyday cigarette smoker in Wave 1 (%)	100% 180 records	100% 168 records	100% 168 records	100% 469 records	100% 148 records	100% 12,585 records
Progression to everyday cigarette smoker in Wave 3 (%)	2.09% (0.07, 4.12%) 5 records	2.26% (0.07, 4.44%) 5 records	10.97% (6.77, 15.17%) 22 records	11.60% (8.35, 14.84%) 56 records	26.18% (18.79, 33.57%) 38 records	1.13% (0.96, 1.31%) 302 records
Remain not everyday smoker in Wave 3 (%)	97.91% (95.88, 99.93%) 175 records	97.74% (95.56, 99.93%) 163 records	89.03% (84.83, 93.23%) 146 records	88.40% (85.16, 91.65%) 413 records	73.82% (66.43, 81.21%) 110 records	98.87% (98.69, 99.04%) 12,281 records
Progression from Not Everyday Smoker in Wave 1 to Everyday Cigarette Smoker in Wave 5						
Not everyday cigarette smoker in Wave 1 (%)	100% 152 records	100% 141 records	100% 142 records	100% 410 records	100% 116 records	100% 10,893 records
Progression to everyday cigarette smoker in Wave 5 (%)	0.95% (0.00, 2.30%) 2 records	1.03% (0.00, 2.50%) 2 records	10.17% (5.07, 15.27%) 21 records	8.19% (5.70, 10.67%) 39 records	24.05% (14.58, 33.52%) 29 records	1.19% (0.99, 1.39%) 277 records
Remain not everyday smoker in Wave 5 (%)	99.05% (97.70, 100%) 150 records	98.97% (97.50, 100%) 139 records	89.83% (84.73, 94.93%) 121 records	91.81% (89.33, 94.30%) 370 records	75.95% (66.48, 85.42%) 87 records	98.81% (98.61, 99.01%) 10,614 records
Progression from Not Everyday Smoker in Wave 1 to Everyday Cigarette Smoker in Wave 6						
Not everyday cigarette smoker in Wave 1 (%)	100% 120 records	100% 112 records	100% 112 records	100% 310 records	100% 94 records	100% 9,015 records
Progression to everyday cigarette smoker in Wave 6 (%)	1.98% (0.00, 4.30%) 3 records	2.15% (0.00, 4.67%) 3 records	8.94% (3.48, 14.40%) 11 records	11.32% (7.61, 15.04%) 36 records	12.36% (5.10, 19.63%) 16 records	1.27% (1.01, 1.54%) 209 records
Remain not everyday smoker in Wave 6 (%)	98.02% (95.70, 100.00%) 117 records	97.85% (95.33, 100.00%) 109 records	91.06% (85.60, 96.52%) 101 records	88.68% (84.96, 92.39%) 274 records	87.64% (80.37, 94.90%) 78 records	98.73% (98.46, 98.99%) 8,805 records

Table 3 continued. Progression among Current Cigar Smoker and Non-current Tobacco User from Not Everyday Cigarette Smoker to Everyday Cigarette Smoker, Wave 4 to Wave 5 and Wave 6.

Parameter	Premium Cigars		Non-Premium Cigars			Not Current Tobacco Users
Progression from Not Everyday Smoker in Wave 4 to Everyday Cigarette Smoker in Wave 5

2.5.2.2 Which Tobacco Product Was Used First: Premium Cigars or Cigarettes?

As conducted for the original July 2018 Report and the July 2022 Report, progression from cigar use to cigarette smoking was further investigated by assessing which product was used first among dual users of both premium cigars and cigarettes. This comparison was made based on the reported age of first cigarette (all or part of a cigarette) or cigar (even one or two puffs) use.²⁸ As noted in Section 3.5.1 and discussed in detail in section 2.4 and Table 2, the PUFs provide age categories rather than the exact ages available in the RUFs that were used in the July 2018 Report. As such, the corresponding output in this report (Table 5) differs from its Table 8 counterpart on page 36 of the original July 2018 Report. The resulting summary is therefore less precise (because age ranges²⁹ are compared rather than exact ages). Nevertheless, the key findings and interpretation remain consistent between the original and the updated analyses described in this report.

As shown in Table 5, traditional cigars³⁰ were rarely used first (only two such participant records identified with an estimated prevalence of less than 1.5% in Wave 1; no such records were identified in Wave 4). First use of cigarettes was far more common, at approximately 45% based on Wave 1 data on dual users. Initiating use of both products at a similar age was nearly 55% based on Wave 1 data on dual users. This analysis was repeated on the Wave 4 replenishment sample, and findings were generally consistent. Very few relevant records were identified (10 total current premium cigar and cigarette dual users), however, and the specific estimates should not be considered as robust. Analysis of Wave 6 data was similarly not possible as zero dual premium cigar and cigarette user records were identified with complete data for the age of first use variables.

²⁸ The “AC1006” variables were used to assess age when first started cigarette smoking (all or part of a cigarette), and the “AG1006” variables were used to assess age when first started using cigars (even one or two puffs).

²⁹ Age range categories for the “AC1006” and “AG1006” PUF variables are as follows: “Less than 18 years old”, “18 to 24 years old”, “25 to 34 years old”, “35 to 44 years old”, “45 to 54 years old”, “55 years old or older”.

³⁰ The PATH survey question regarding first use does not specify whether the traditional cigar was premium or not and no brand or product information was collected as follow-up. Therefore, the first used traditional cigar cannot be designated further as premium or non-premium.

Table 5. First Product Initiated Among Current Dual Users of Premium Cigars and Cigarettes, Wave 1, Wave 4, and Wave 6

Value	Survey Wave	First Product Initiated Smoking
(1) Cigarette first	Wave 1	45.03% (35.44, 54.61%) 51 records
	Wave 4	33.76% (0.45, 67.07%) 4 records
	Wave 6	<i>No available records</i>
(2) Traditional Cigars first ³¹	Wave 1	1.36% (0.00, 3.32%) 2 records
	Wave 4	<i>None reported</i> ³²
	Wave 6	<i>No available records</i>

2.5.3 Dual Use of Premium Cigars and Other Tobacco Products, Wave 1 – Wave 6

As in the July 2018 Report and July 2022 Report, dual use of cigars and cigarettes was examined by assessing cigarette smoking behaviors among cigar smokers, and cigar smoking behavior among dual users of premium cigar and cigarette smokers relative to users of premium cigars only. As shown in Figure 7 (with plotted values presented in Appendix C, Table C- 6), most current premium cigar users did not also currently smoke cigarettes and cigarette smoking frequency and intensity was generally low among this user group.

Current cigarette smoking was approximately 50-60% for nonpremium traditional cigar and cigarillo users, approximately 60-70% for filtered cigar users; compared to less than 25% of premium cigar users based on Wave 4 through Wave 6 data. Among dual users, less than half of premium cigar dual users smoked cigarettes every day, whereas approximately 60% or more of nonpremium cigar users smoked cigarettes every day. In addition, days of cigarette smoking in the past month and number of cigarettes smoked per day on days smoked or more generally in the past 30 days was least among premium cigar dual users.

³¹ The PATH survey question regarding first use does not specify whether the traditional cigar was premium or not and no brand or product information was collected as follow-up. Therefore, the first used traditional cigar cannot be designated further as premium or non-premium.

³² Wave 4 has limited data that is relevant to the first product used question, but there are a few records in which age at first use is available for both traditional cigars and cigarettes which is why the data is listed as “none reported.” Wave 6 asks the same questions, but there are zero premium cigar using participants with data entered for age at first use for both traditional cigars and cigarettes which is the reason for the data listing to be “no available records.”

Figure 7. Dual Use of Cigars and Cigarettes, Wave 1 to Wave 6.

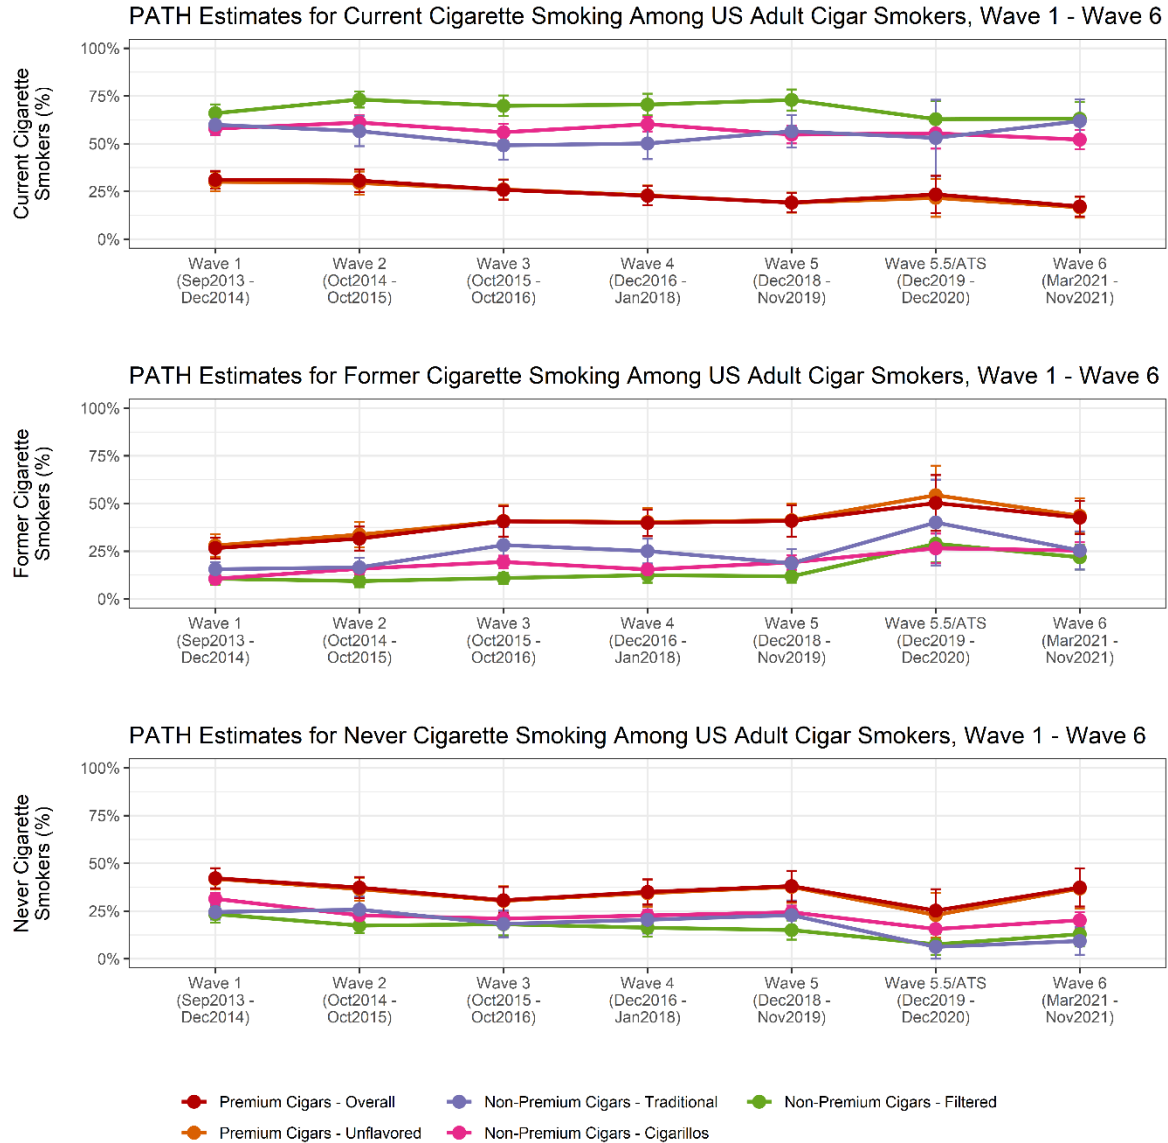

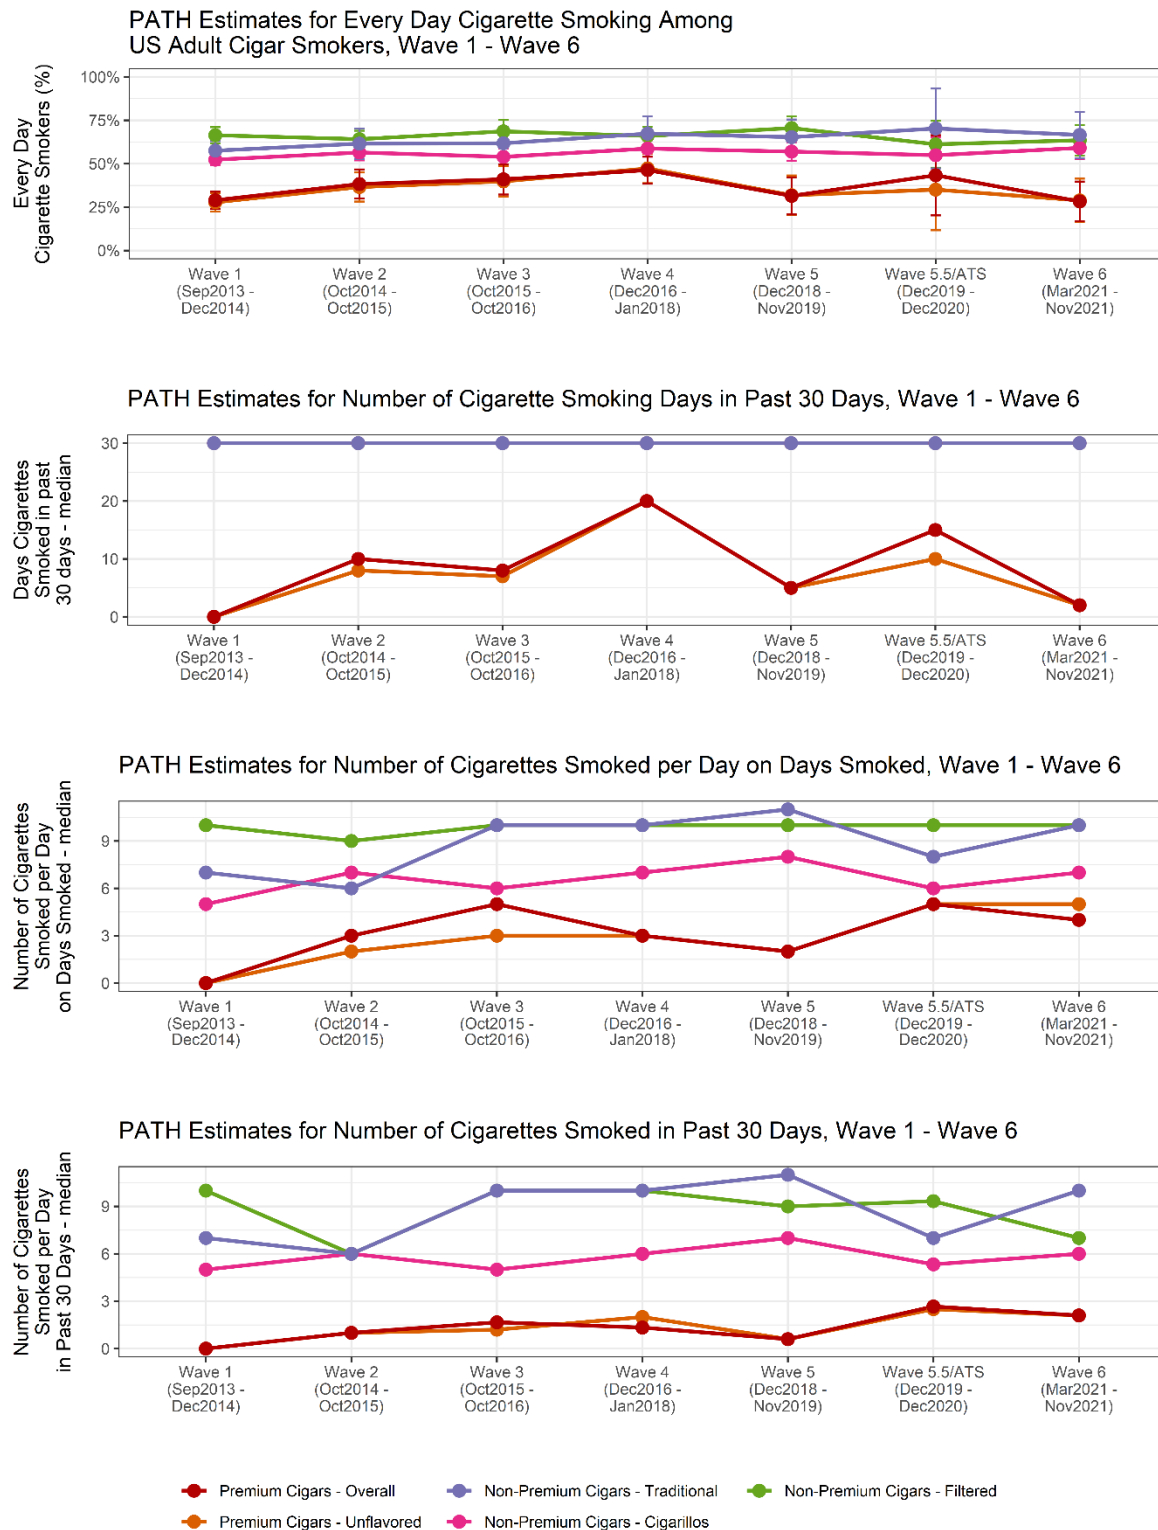

Figure 7 continued. Frequency and intensity of cigarette smoking among cigar users.

Note: In the bottom three subplots, only point estimates for the median are shown for clarity as the IQR estimates are wide with considerable overlap across products. The corresponding table (Appendix C, Table C- 6) reports median, IQR, and number of corresponding participant records for each parameter.

Figure 7 Alternative (bar charts instead of line charts). Dual Use of Cigars and Cigarettes, Wave 1 to Wave 6.

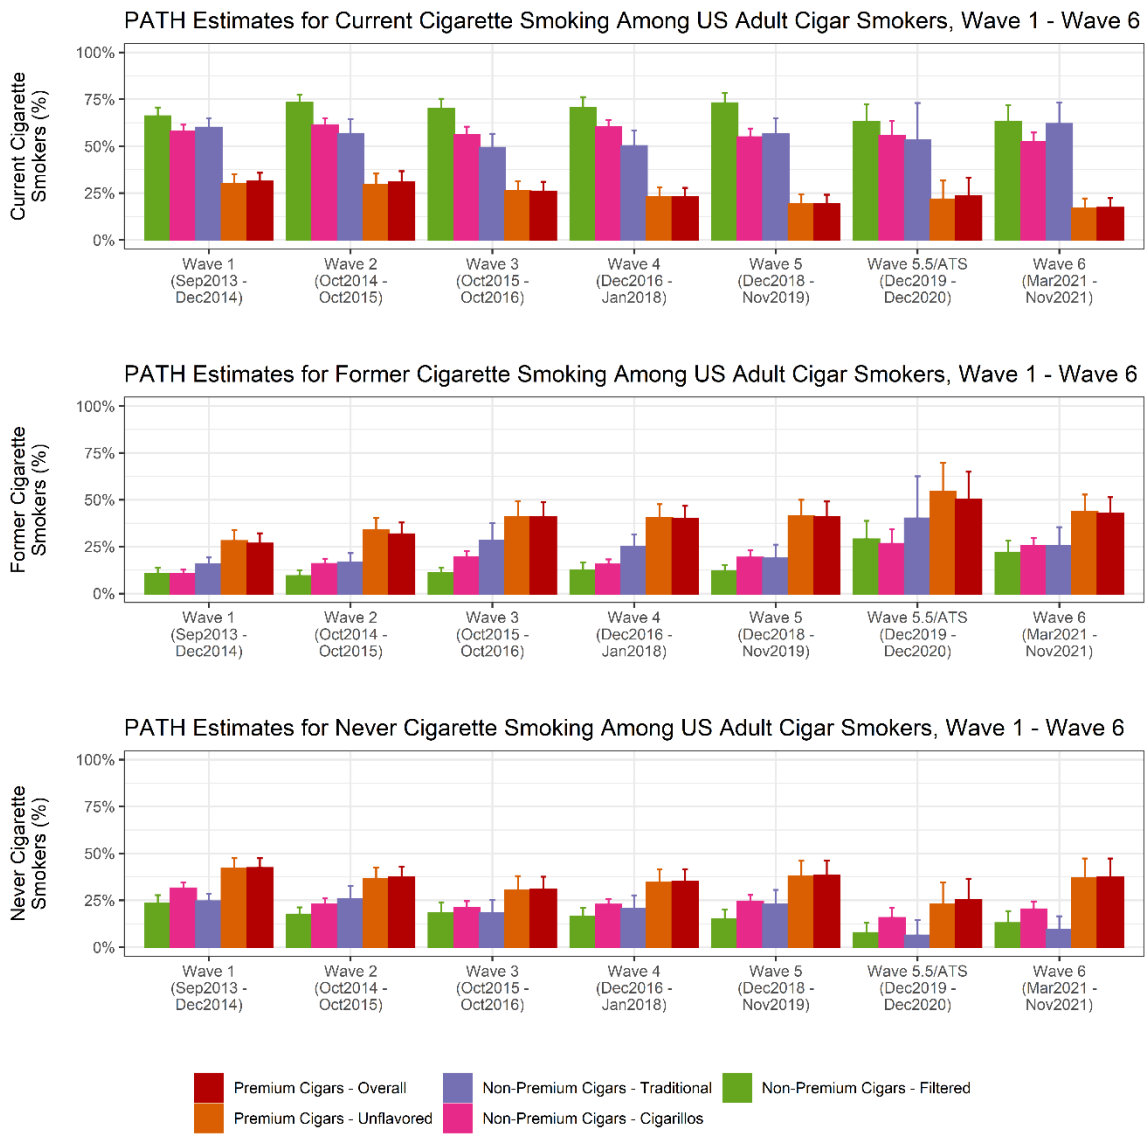

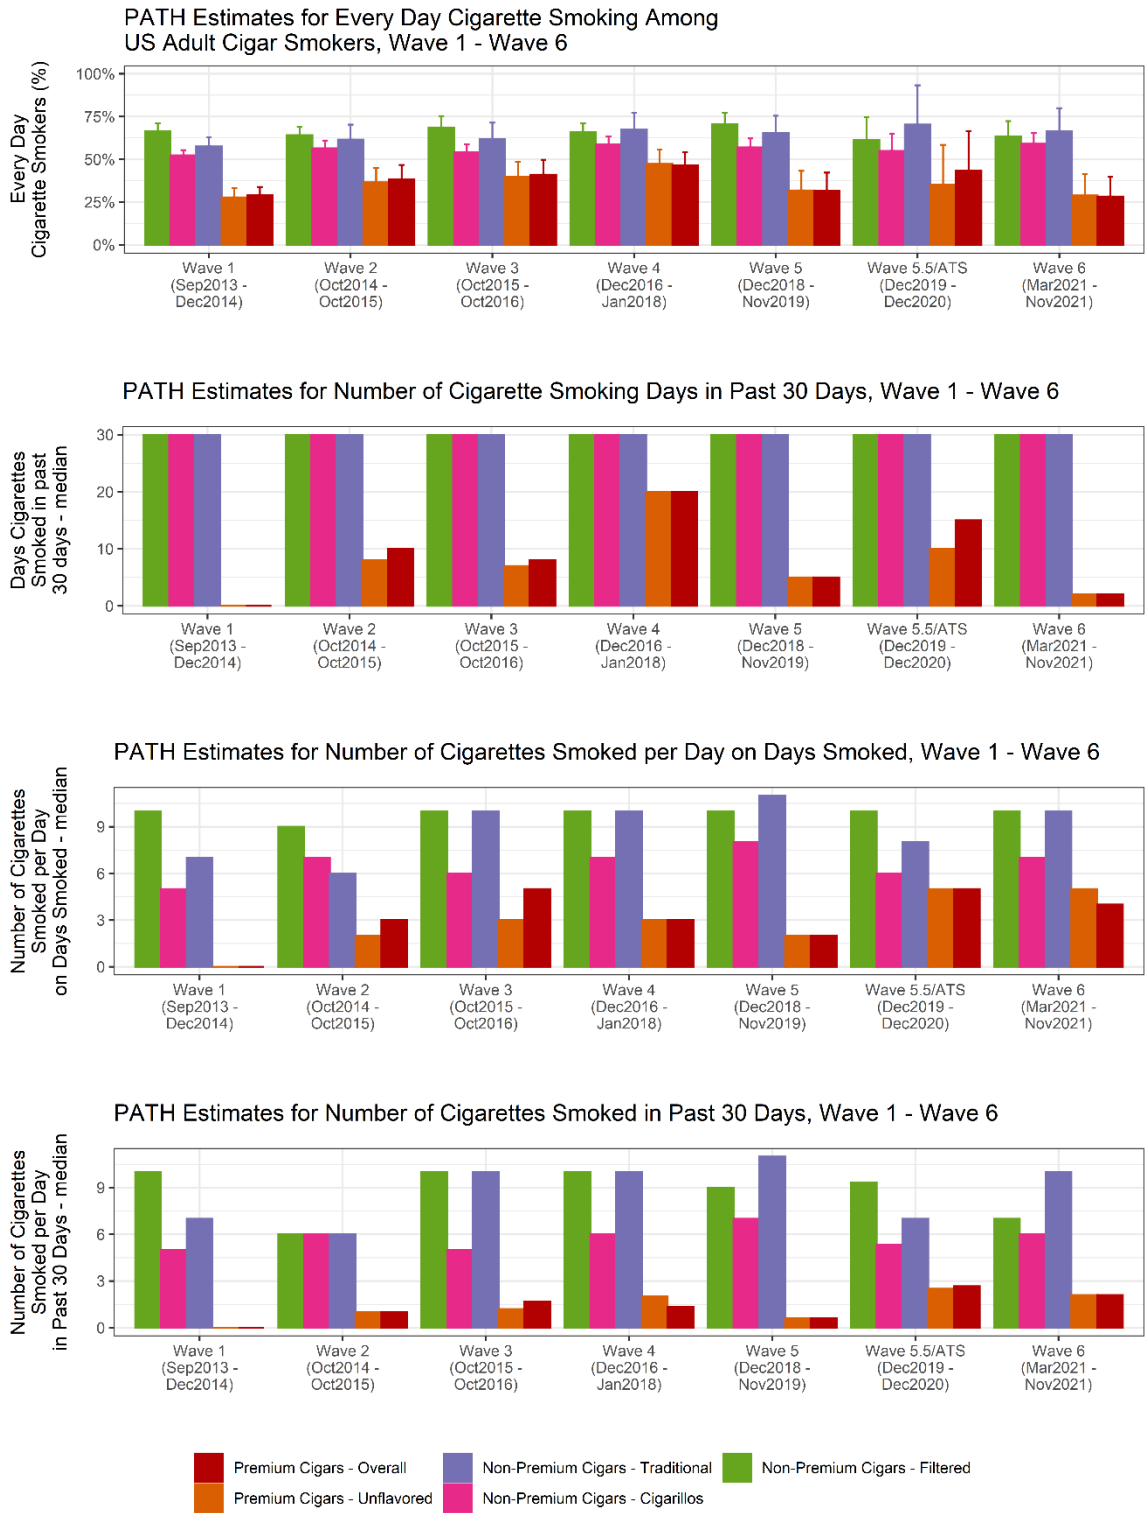

Figure 7 Alternative continued. Dual Use of Cigars and Cigarettes, Wave 1 to Wave 6.

Note: In the bottom three subplots, only point estimates for the median are shown for clarity as the IQR estimates are wide with considerable overlap across products. The corresponding table (Appendix C, Table C- 6) reports median, IQR, and number of corresponding participant records for each parameter.

When looking at cigar smoking behavior among premium cigar dual users, and as noted in the July 2018 Report and July 2022 Report, current premium cigar dual users did not smoke more premium cigars than those who smoked only premium cigars. As shown in Table 6. Premium Cigar Smoking by Cigarette Smoking Status, Wave 1 to Wave 6, the prevalence of everyday cigar smoking was similarly low (less than 10%) when comparing premium cigar users who also smoked cigarettes to those who did not. Similarly, estimated median smoking days per month and median number of cigars smoked per day (when calculated per smoking day or over the course of the past month) were similarly low. The estimated median for number of days on which premium cigars were smoked varied between one or two across all Waves, regardless of whether users also currently smoked cigarettes. Similarly, the estimated median number of premium cigars smoked per day on days smoked was one across all waves, and considerably less than that if calculated on a per month basis. Analysis of users of only unflavored premium cigars yielded essentially identical results (Appendix D, Table D- 1).

Table 6. Premium Cigar Smoking by Cigarette Smoking Status, Wave 1 to Wave 6.

Parameter	Survey Wave	Premium Cigar & Current Cigarette Smoker	Premium Cigar Smoker Only
Now smoke premium cigars every day (%)	Wave 1	5.08 (0.77, 9.38) 6 records	5.87 (2.80, 8.94) 15 records

3 CONCLUSIONS

The January 2024 Report is consistent with the July 2018 Report and July 2022 Report

- Youth Usage: Youth usage of premium cigars is lower than any other tobacco product. *Only 0.09%, 0.05%, and 0.02% of youth reported use of premium cigars in Waves 1, 2 and 3 respectively, and in fact not a single youth participant reported smoking premium cigars in Waves 4, 4.5, 5, 5.5, or 6.*
 - No youth participants reported smoking flavored premium cigars in any Wave of the PATH Study.
- Adult Prevalence: Premium cigar usage among adults remained below 1% through all Waves of the PATH Study for overall premium cigar use, unflavored premium cigar use, and by extension flavored premium cigar use.
- Demographics: Demographics of adult premium cigar smokers were unchanged through all Waves of the PATH Study; namely that this population is comprised typically of white males, mostly 35 years or older, who are well educated, and have higher socio-economic status.
 - There are no statistically significant demographic differences between the adult users of all premium cigars and unflavored premium cigars, and by extension flavored premium cigars.
 - The demographic data for all Waves only applies to adults as there was either too few or no reported youth usage of premium cigars to prepare the same analysis.
- Frequency and Intensity:
 - Across all Waves of the PATH Study approximately 95% of adult premium cigar users smoke occasionally (less than every day).
 - Across all Waves of the PATH Study the median number of adult premium cigars smoked per month was 1.0-2.0 premium cigars.
 - Both of these findings apply for overall premium cigars and unflavored premium cigars, and by extension flavored premium cigars.
- Initiation and Progression to Other Tobacco Products:
 - There is no statistically significant difference regarding age of initiation across all Waves of the PATH Study for overall premium cigars, unflavored premium cigars, and by extension flavored premium cigars.
 -
 - There is no statistically significant difference regarding progression to use of other tobacco products across all Waves of the PATH Study for overall premium cigars, unflavored premium cigars, and by extension flavored premium cigars.
 - Progression to everyday smoking among premium cigar users who did not previously smoke cigarettes daily is less than 2% of users.
 - In all Waves of the PATH Study, except for one reported record those premium cigar smokers that progressed to smoking cigarettes, smoked only unflavored premium cigars.

- Most current premium cigar users did not also currently smoke cigarettes, and cigarette smoking frequency and intensity was low among this user group (less than five cigarette smoking days per month, and less than five cigarettes smoked on those days).
- Current premium cigar dual users did not smoke more premium cigars than those who were not dual users and did not smoke premium cigars with more frequency or intensity than those who were not dual users.

In sum, the findings based on the more recent Wave 5.5/PATH-ATS and Wave 6 data on premium cigar use in the U.S. simply extend the findings identified in the July 2018 Report based on Wave 1 through Wave 3 data and the July 2022 Report that also incorporated Wave 4, Wave 4.5, and Wave 5 data. Taken together, the findings presented in this report are all consistent with those presented in the July 2018 Report and the July 2022 Report, namely: (i) that youth use of premium cigars is extremely rare and is undetected in the most recent PATH data collections, flavored or unflavored; (ii) adult prevalence is below one percent whether one looks at premium cigars overall, unflavored premium cigars, or by extension flavored premium cigars; and (iii) the demographics of adult premium cigar smokers remained consistent through all Waves of PATH data and for overall premium cigars, unflavored premium cigars, and by extension flavored premium cigars. Trends were consistent across the first three waves (2013/14 through 2015/16) and that consistency has continued or even improved (e.g., undetected youth use in most recent waves) for the premium cigar product class from Wave 4 through Wave 6 (2017/18 through 2021).
